Executive Briefing

Remote network management is a headache. In a recent study, 70% of the 180 companies contacted by research firm Business Research Group identified management of distributed computing as a critical concern. *Page 59*

Is it any wonder some folks decide to just stay put? That's exactly what chemical company Rödel did recently — settling for an upgrade to its HP 3000 mini — after flirting briefly with Unix. Reason: HP promises Unix and MPE will merge in a couple of years, and the company figures it is safer to stick with what it knows than to take a risk on just-emerging systems management tools for Unix. *Page 69*

Or that others seek some outside assistance? There's lots of activity on the horizon from three days. After listening to informal proposals for close to a year, Chrysler is reportedly about to issue a formal invitation to bidders that want to help it develop and manage a massive LAN. Linking some 13,000 PCs throughout the organization, *Page 6*. In the meantime, Nilesco and EDG may qualify for a speed award. Six weeks after EDG won the contract last July, Nilesco's Green Bay, Wis., data center was shut down and EDG was processing product and sales data for Nilesco market reports. *Page 67* But the prize for most innovative pricing agreement may belong to the Canada Post and SIIH Systemhouse, Inc. contract, which established a "fee-for-service" structure similar to that of a monthly telephone bill. *Page 25*

Deliver us from gateways was Internet pioneer Elmer Steffendorf's message in his address to attendees of E-Mail World. Using gateways to translate messages into different formats of each messaging system is unacceptable, he said, and customers ought to demand a way of sending messages intact through all their systems. *Page 14*

Mixed messaging that does work: E-Mail World saw the introduction of a scanner/software combination that permits documents with graphics to be scanned and dropped into E-mail and computer-based fax software. *Page 14*

Tallied training gains popularity as companies try to adapt to the very different requirements of new system development tools and methods. IBM even links technical training with specific projects. *Page 88*

One good subject for training: Windows GUI development might be a good bet. Columnist David Bernard points out that while Windows application development has become much easier, it's still very possible to mess up on interface design. *Page 75*

OS/2 developers to get first whiff of Taligent

By Ed Scannell and Jim Daly

With IBM ready to roll out its first set of application frameworks from its Taligent, Inc. joint venture with Apple Computer, Inc., software developers have little knowledge of what the technology can do.

This first set of frameworks, scheduled to be sent to a limited number of developers next month, gives OS/2 developers their first taste of the Taligent technology. It will also make it easier for them to port their existing applications to multiple platforms including IBM's AIX and Windows [CW, July 26]. Broader distribution will occur early next year.

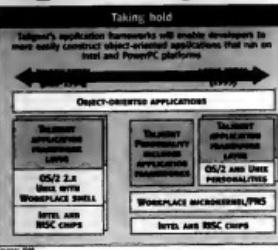

Meanwhile, IBM will release a second set of application frameworks in late 1994 that exposes the entire Taligent programming model to developers, who can then script applications that take full advantage of Taligent's interface and that inherently work in a collaborative fashion with any other application.

Mix-and-match technology

IBM will also use next week's Comdex/Fall '93 to show how some of the stand-alone Taligent components can be mixed and matched with an array of existing programs to piece together applications that collaborate across multiple platforms.

"We'll be showing off the stand-alone components used in a cross-platform graphical user interface framework and combined with IBM's System Object Model and IBM's Distributed Object Model," said Kathy Bohrer, IBM's lead architect for object frameworks.

Although the company will deliver application frameworks first, Taligent remains committed to producing a shrink-wrapped version of the full Taligent operating system in the 1995

Power-packed

Using a low-level example to show developers the power they can get with the second set of frameworks, IBM said it created a calculator program that has undo and redo features and allows two people to collaborate on the same set of data simultaneously. It took only 70 lines of code to create the program, using the Taligent technology, compared to 3,000 to 4,000 lines of code to do the same program under Windows or Presentation Manager.

Windows or Presentation Manager.

Taligent's application framework's shift towards developer tools for more easily construct object-oriented applications on Intel and PowerPC platforms

time frame, noted Mike Potel, Taligent's vice president of technology development. "Both projects are running in parallel," he said.

Application developers, however, have been left to uncover what specific advantages they will gain over competitors by incorporating the Taligent technologies.

"One word about the frameworks' content gets out, we can then stow about what we should take advantage of and how," said Randall Flint, president of Sundial Systems Corp., a Seat Beach, Calif., OS/2 application developer.

With the introduction of Apple's PowerPC platform looming, Taligent officials have been particularly circumspect with key Apple developers. "The last thing Apple wants to do is add another choice for developers to think about," said Peter Hartsook, editor of the Macintosh-specific "Hartsook Letter" in Alameda, Calif. "I bet they won't say much about Taligent until after the PowerPC Macs come out early next year."

Many Apple developers said their chief concern is getting their applications over to the PowerPC platform, but they are still curious about Taligent.

"You talk to developers who might be interested, and it seems that nobody has put this thing on the front burner at this point," said Mark MacClellan, managing director at H&M Consulting in Sunnyvale, Calif.

Because Taligent is not expected to have its full platform available until 1995 at the earliest, developers are not panicking. "I don't think it

will be any big thing if we're not there on Day 1 with a Taligent product," said Chuck Boeserberg, product marketing manager of the Apple Point Software, Inc. in Beaverton, Ore.

Not that Apple developers are twiddling their thumbs. Most are up to their ears working on versions of Macintosh System 7 applications for the upcoming PowerPC line, and they're cautious about where they put their money and manpower.

"Look at the people who put their efforts into OS/2. They wanted their resources," added an Adobe Systems, Inc. spokesman. Companies such as Adobe said they do not have resources to kill several platforms at the same time.

More opportunities

The first set of application frameworks for OS/2 will let developers infuse their existing applications with features such as advanced data manipulation and two- and three-dimensional graphics.

The second set of frameworks, due later next year, will give developers the opportunity to write applications that fully exploit the Taligent operating system. One of the biggest advantages touted by both Potel and Bohrer is the ability to create genuinely collaborative applications that easily share data across environments.

One of the benefits of the Taligent application programming interface, Potel explained, is that a system software automatically knows how a particular application is structured and it can present the same document or memo to another application across a network.

"If two people are working on a letter, they could open up any old word processor and over the phone argue about what changes to make," Potel said. "You can get some of that today, but the nice thing with Taligent is that any app you write is automatically built that way."

OS/2 is making headway in the corporate arena.

Page 37

IBM taps Cannavino as top tech exec

By Johanna Ambrusko and Ed Scannell

IBM strategy guru Bernard Puckett resigned unexpectedly last week. He will be replaced by James A. Cannavino, currently general manager of IBM's Personal Systems division.

Puckett, 49, is leaving the company to "explore opportunities to go into business for himself," according to a statement issued late Friday. Puckett had been named senior vice president for strategy only in June.

Analysts said Puckett's selection was a mistake from the start. "Gerstner picked the wrong guy for a key position; he has now reversed himself," said Bob Djordjevic, president of Anax Research in Pleasanton.

Many observers were taken by surprise. "The whole thing is very strange," said Jay Stevens, an analyst at Dean Witter in New York.

"I can't figure out why a guy who appears

to be a rising star in the firm gets a key position and before he gets a chance to do anything right or wrong, is gone," said Curt Saurin, a vice president at First Boston Corp. in New York.

Cannavino has presided over a resurgence in IBM's PC business over the past year — particularly in the Co. and the request success of several Software Products' OS/2. But some note that he was also in charge when the company's hardware market share slid precipitously in the late 1980s and early 1990s.

Maverick technologist

What appears to be in Cannavino's favor, however, is his thorough understanding of technologies ranging from mainframes to PCs and, perhaps, his reputation as a maverick within IBM.

"Cannavino is one of the few guys who, given enough power, can make some of these Jurassic Park inhabitants come to the 20th century," said Frank Dubnick, president of Communications Network Architects, Inc. in Washington.

Cannavino reportedly told consultants last week that he was aware of the need for his new division to spend the next few months in a "discovery phase." Cannavino, through a spokesman, said a successor is expected to be named in a few weeks.

Cannavino, also 49, started with IBM 30 years ago as a customer engineer. He was appointed president of the company's Data Systems Division in 1987 and named president of its PC business in 1989, assuming responsibility for all Personal Systems business in September 1989.

PowerPCs roll

IBM's Power Personal division this week will debut its first series of long-awaited PowerPC-based servers and desktop systems.

One of the highlighted features of the new systems, according to an analyst brief, is a track, in built-in voice recognition that allows them to intelligently converse with users.

IBM will also detail support for a broad range of 32-bit operating systems for the PowerPC-based machines, including Microsoft Corp.'s Windows NT, IBM's AIX and WorkPlace/OS, and Taligent, Inc.'s operating system [CW, Nov. 1].

—Ed Scannell

Gentlemen, start your snails.

PC Magazine independently defined and ran a battery of real world performance tests to compare database server software. PC Magazine states, "Oracle7 was the hands down winner on our performance tests, outperforming the others by a wide margin."

Where Sculley's vision blurred

After Sculley, Apple lacks key visionary," read the headline in the *San Jose Mercury News* after John Sculley's departure. Personally, I think the name could have been said for Apple with Sculley.

"Visionary" was the term Sculley repeatedly used to describe himself in his book "Odyssey," a self-absorbed account of how he anointed Steve Jobs. Jobs, of course, was a genuine visionary even if he was an abysmal businessman. He deplored him, Sculley let out of the company without a cent.

But it was never clear to the public what Sculley's "vision" benefited Apple. I think he added Novell's user group in Salt Lake City last year when he shared his vision of the future with a hushed audience. I may have missed some of the details, but I recall him saying that the \$80 billion PC industry, the \$1 trillion consumer electronics industry and the \$1.3 trillion media publishing industry were going to merge into a new industry worth a pentaquadrillion dollars by the year 2001.

Wow, I thought, this Sculley can really see over the horizon, and he's got the charts to prove it. But right now, Microsoft is selling 1.5 million copies of Windows a month, while Apple is selling 1.5 million Macintoshes a year. I wonder where that leaves the Mac by the year 2001? I tried and I tried to figure it out, but the prospect of all that money waiting to be made daunted me too much to think about it.

Sculley led Apple into overinvesting in the future with gadgets. The Newton personal digital assistant can tell you where Elvis is located on any given day, but it still can't spell your name right.

While the personal digital assistant was a success, Apple's other over-promises didn't pan out. Apple's iMac, a super over-promised \$1,200-a-year ago, with Windows still in a shake-down cruise, Sculley kept Macintosh prices high, satisfied with Apple's 11% market share and high margins. As Windows improved and the PC market exploded, Mac prices stayed too high for too long. What had been a huge lead in the graphical user interface was frustrated away with no market share gains for Apple.

No more "I'm a"

With Apple's fundamental strategy in retreat, Sculley rushed into a hollow embrace with IBM. Instead of forging the hammer that would smash Big Brother, Sculley made Apple into a company more like IBM, too distant from its customers and too dependent on an overweening pride and self-image to respond to changes in the marketplace.

But what Sculley did is that he had to forgive was name himself chief technology officer at Apple, as well as chairman and CEO. Sculley, the marketing person, insisted on taking the title to which he had the least legitimate claim. I mean, this is a man who admitted telling Jobs, "Whoa, why are you talking to me? I don't know anything about computers."

Chief technology officer is usually a head held by someone who has shown leadership in driving the product line. What did Sculley do for the Mac besides sue Hewlett-Packard and Microsoft?

"It was embarrassing to nominate myself as technology officer," he agreed on *Good Morning America*'s TV show this year, but he said he had to do it to boost his effectiveness as a Silicon Valley spokesman.

So when Bill Clinton wanted to polish his high-tech connection, there was Sculley at his elbow — during the campaign, the inauguration and the State of the Union. It was hard to tell what Clinton knew about technology, but it was clear Sculley knew something about politics.

Sculley's wish to be a high-tech statesman overwhelmed his interest in running Apple as a business, and Apple missed out on the bulk of the second PC revolution — the explosive growth in the use of the graphical interface that it almost single-handedly launched.

he was at
marketing
Apple.

Corporate decentralization

CIO ousted from Bank of Boston

By Joseph Magluta

Michael Simmons, the highly paid and highly visible technology chief whose fast-track career advanced through many prestigious banking posts in the late 1980s, was forced to resign in a high-profile shake-up that eliminated his post at Bank of Boston Corp.

His departure came as part of a dramatic corporate decentralization, cost-cutting and corporate shuffling announced Oct. 29 that surprised the financial community and left uncertain the fate of several long-term information systems initiatives at New England's second largest bank.

Since joining Bank of Boston in 1990 from BankAmerica Corp., Simmons, 54, had embarked on an ambitious five-year plan to streamline the bank's disjointed IS operations and electronic-mail systems. As group executive vice president for technology and operations, he commanded a centralized IS staff of 3,100 and a \$169 million annual budget.

Simmons, who reported to Chairman Ira Stimpson, also sat on the five-member board of the bank holding company.

Split in half

Under the new structure, IS functions will be split between two smaller organizations reporting to Executive Vice President Edward A. O'Neal, a former Simmons peer who heads the New England Banking Group division of Bank of Boston. A well-regarded consumer banking executive, O'Neal is considered extremely technology-savvy. Before coming to Bank of Boston a year ago, he served as vice chairman at Chemical Banking Corp., where he managed several technology units.

As part of the restructuring, O'Neal and Chief Financial Officer William Rhine were promoted to vice chairmen in a new four-member chairman's office. O'Neal will also serve as liaison between the two IS groups and a new 29-member "corporate working committee" made up of senior executives.

A bank spokeswoman said no further IS cuts are planned. Simmons could not be reached last week. His future plans are unknown.

Observers and bank insiders said they do not view Simmons' ouster as a sign that he had failed to meet lofty performance expectations. Instead, many agreed with the official explanation: that realignment and flattening would better position IS to serve each of the bank's newly empowered 15 core businesses.

"Simmons was very well-respected," explained an IS manager at the bank who requested anonymity. "It just didn't make sense to have so many people at that high a level," the manager said, referring to Simmons' ousted staff, and the departure of two other

high-level bank executives.

Joseph Zinck, an Ernst & Young analyst who follows the information officer issue, said:

"They made the decision that the four-member team is the group who will run the bank. The other guys didn't need to stick around."

Although his current salary is unknown, Simmons left *Computerworld* in 1990 that his compensation exceeded \$400,000 a year at Bank of America.

Art Gillis, a veteran banking technology consultant, said Simmons' big paycheck may have made him a more attractive target for layoff. "He may be the greatest guy in the world," Gillis said, "but there's a certain cap on the value of one man's contribution."

Chrysler weighs outsourcing plan

By Mark Halper

■ Chrysler Corp. is considering outsourcing a LAN development and management project that would improve communications among some 13,000 PCs throughout the organization, according to outsourcing vendors.

The E\$5.1 billion automaker has been informally soliciting LAN schemes from outsourcing companies for almost a year and is now close to issuing requests for proposals (RFP), according to sources at prospective bidders.

One source close to the company who asked not to be identified said the deal could be worth between \$20 million and \$80 million annually over three years and that Chrysler will issue its RFP on Nov. 15.

"They solicited input from a number of companies earlier this year — a what-if type of thing," said Harvey Cohen, director of commercial operations at Unisys Corp.'s system sup-

port operations. "It is our understanding that they are ready to go forward with an RFP."

Chrysler wants to improve the interactivity among its base of proliferating PCs, many of which have been acquired on a departmental basis without the coordination needed to enable useful connectivity, Cohen said. Chrysler probably needs to standardize on applications and electronic-mail programs, he observed.

A Chrysler spokesman said only that PC management is under review as it is under review every year.

As in all outsourcing evaluations, Chrysler may decide to leave the job up to its own information systems department.

Chrysler is believed to have held conversations with Unisys, Digital Equipment Corp., which provides PC maintenance to Chrysler, IBM's Integrated Systems Solutions Corp. (ISSC) and Memorex Telex Corp. The automaker has also talked with a Chrysler subsidiary, Chrysler Systems, Inc., in Oak Brook, Ill.

"They are talking about putting out an RFP, and we expect to get one," said Jim Lindner, president of the networks group at Memorex Telex, which supplies 3270 terminals, PCs and services in Chrysler.

Digital, ISSC and Chrysler Systems all declined to comment.

Informix to sell Windows NT with its database

Release aims to challenge similar bundling of Oracle and NetWare

By Kim S. Nash

Informix Software, Inc. is expected to release in January a kit that bundles Microsoft Corp.'s Windows NT, Informix-SE Server and sundry Informix connectivity tools at a price less than half the cost of buying the products separately.

Targed as a platform for department-level client/server systems, the bundle will compete head-on with a similar database/operating system package offered by Oracle Corp. and Novell, Inc. [CW, June 7].

Bundled up

The \$1,795 Informix/Microsoft bundle is available through Microsoft resellers, Informix VARs and directly from Informix. Bought separately, the products would cost about \$3,000. The bundle includes the following:

- The Microsoft Windows NT operating system.
- The Informix-SE 5.0 database.
- The Informix-SQL suite of development tools, including forms and report writers and schema editors.
- The Informix-ESQL/C third-generation language for building applications that access databases through standard SQL.
- Q+E ODBC Pack, an Open Database Connectivity (ODBC) driver that Informix results from Q+E Software.

Informix is reselling NT under an agreement with Microsoft, which in turn will allow its 3,000-plus solution providers to resell the SE Server database. Microsoft will continue to aim its SQL Server database at low-end LAN users.

Talking to NT

The theory behind the Informix/Microsoft partnership is that users will be able to get Unix applications running against an Informix database to take advantage of Windows NT-based security. "Coexistence of NT and Unix is probably what most big companies will find most useful," said Fred Hubbard, president of the Northern California Informix User Group.

Such scenarios have yet to arise, Hubbard noted, "but it's good to know in the back of your mind that Informix users have that option."

What NT users will get is access to more than 10,000 applications currently available for Informix databases. But porting Informix packages to NT is viewed mainly as a safety net by Informix

resellers afraid of being left in the dust should NT blossoms into a viable enterprise-level operating system.

"No one is beating our doors down saying they gotta have NT, but users are starting to get excited about it. So we'll be there when they want to buy later on,"

said Bob Bearden, president of Munich Information Systems, Inc., an Informix value-added reseller (VAR) in Clifton, N.J.

"We haven't gotten anyone committed to NT today, but we have seen interest," agreed John Woolsoncroft, director of

marketing at Concepts Dynamic, Inc., a VAR in Schaumburg, Ill.

The Informix/Microsoft package is priced at \$1,795 (see box). The Oracle/NetWare bundle is priced at about \$250 per user, according to Larry Ellison, chief executive officer at Oracle. However, that kit does not include utilities such as an Open Database Connectivity driver. Informix plans to port its high-end On-Line database to NT next year.

Consolidates Free Extents and Releases Unused Space 50 to 80% Faster than IBM's DFSMS DEFRAF...with the added value of:

- Releasing Space from VSAM and DB2 files
- Releasing All or a Percentage of Unused Space during COMPACT and Stand Alone
- FASTCPK offers CANCEL Protection and Full Recovery from job or System crashes
- Positioning Data Sets by Last Reference Date or User Specified
- Expanding and Positioning the VTOC
- Combining Extents on VSAM, DB2, PS and PO Data Sets

News Shouts

Apple cleans house

Springcleaning is coming a few months early at Apple Computer, Inc., which has scheduled three large auctions to clear tens of millions of dollars worth of old, excess inventory from its warehouses. Apple plans to offer more than 10,000 discontinued Macintoshes and peripherals at the auctions, scheduled to occur in the next month in Des Plaines, Ill.; Framingham, Mass.; and Washington.

Globex struggles and restructures

After 16 months in operation and no profits to show, Chicago's \$100 million, after-hours futures trading system, Globex, is being restructured. The major change will be to open the computerized system to two powerful European futures exchanges, one in London and the other in Paris. The concessions are seen as a last-ditch effort to save Globex and increase its trading volume — now at about 29,000 contracts daily.

Software pirates sentenced

One man is in prison and another serving home detention, what is believed to be the first software piracy case in U.S. history to result in a jail sentence. Steven S. Lee and Norman Chen in Fremont, Calif., are serving time after pleading guilty to misdemeanor software infringement charges in connection with a software counterfeiting ring. The operation allegedly manufactured and distributed at least 25,000 copies of Microsoft Corp.'s DOS operating system, causing an estimated \$1.5 million in lost sales.

AT&T and 3Com team for fast Ethernet

3Com Corp. last week announced a joint development pact with AT&T Microelectronics aimed at bringing 100M bit/sec. Ethernet products to market quickly. The two firms will co-develop physical-layer devices for 100Base-T, 100M bit/sec. Ethernet products incorporating the IEEE 802.3 carrier-sense multiple access with collision detection media-access control standard. The transceiver silicon will support Categories 3, 4 and 5 twisted-pair cable.

Study singles out successful CIOs

Many chief information officers are being held responsible for their teams' performance to reinforce their roles as technologists and business leaders, according to a study released by Ernst & Young, Heidrick & Struggles, Inc. and Boston University. Two distinct types of successful CIOs were detected: the company careerist and the professional CIO, who is often brought in from the outside to turn around a company. Successful CIOs balance their role as technologist, utility manager, research and development director and infrastructure builder, the report pointed out.

SHORT TAKES Montgomery Ward, the giant Chicago retailer, is installing 130 Novell, Inc. LANs and assorted NCR Corp. workstations and servers in a project valued at \$4.5 million. The retailer will use Entex Information Services in Rye Brook, N.Y., as the integrator. ... AT&T Communications has restructured its internal information systems operation, naming Rino Bergogni — former CIO at United Parcel Service, Inc. — vice president of AT&T's Information Management Services organization. ... BSG Consulting, Inc., a Houston systems integrator, last week established a subsidiary to help companies manage the transition to client/server computing. ... Intel Corp. will announce a 3.3V, 50-MHz DX3 chip this week, which it claims is its highest performance chip to date. The new SL Enhanced Intel 486DX3 is reportedly twice as fast and consumes half the power of the SV 486DX chip, while costing about the same.

Microcomputers**Digital PCs to support Intel, Alpha**

By Craig Stedman
STORY MARS

In a continued effort to increase its PC presence, Digital Equipment Corp. this week will introduce an upgradable premium line that uses the Peripheral Component Interconnect (PCI) bus and will eventually support either Intel Corp. microprocessors or Digital's own Alpha AXP devices.

However, the Alpha option is not scheduled to be available on the DECPc-XL motherboards until next spring, Digital said. The company previously confirmed it had postponed the launch of Alpha-based systems equipped with the PCI bus in order to wait for a lower-cost microprocessor [CW, Oct. 18].

Upgrade offerings

Positioned above the DECPc-LPx value line introduced in August, the XL systems are initially being offered with Intel 486 and Pentium chips. In-box upgrades are possible via a daughterboard swap, and Digital said upgrades from the Intel devices to Alpha will also be supported.

The dual-path strategy is meant to part ways Digital's image as "a me-too [PC] company," and probably a slow one at that, said Lex

Dekkers, XL product line manager. The XL's minilowever enclosure can handle clock speeds of up to 200 MHz and should accommodate both the second and third generations of Pentium, he added.

The upgrade capabilities appeal to Andre Hallam, senior office automation analyst at Children's Hospital of Eastern Ontario in

Pentium boxes first and foremost since it remains unclear how much single-user demand there will be for the Alpha versions running Microsoft Corp.'s Windows NT.

High performance

Digital's pricing is not especially aggressive, but the \$60-million Premium-based XL 500 series rating on the 100-MHz Premium-based XL as "a screamer," according to Zwetschkenbaum.

"You've got to give them their due in that respect. They managed to put together a very high-performance platform," he added.

One lingering issue, though, is Digital's lack of sales through indirect channels. The company's PC business unit signed several distribution deals last summer, but Winnie Briney, U.S. marketing director for PCs, acknowledged that a channels support infrastructure is still in the formative stage.

"We don't even have full-time sales teams in place on each of the channels yet to make sure we're fully exploiting them," said Briney, who joined Digital in September. She added that she expects Digital to be more competitive in the channel area by the first quarter of 1994.

Ottawa. "We go through a lot of PCs here, and [upgrading] is obviously cheaper than replacing a box with a whole new system," he said.

Digital's promise that an Alpha upgrade will cost less than \$2,000 "sounds great," Hallam said. He added that his interest in the high-end moves more with Alpha than with Pentium. "If I want a power-user PC, there's no sense buying a mid-line or road-Pentium," he said.

However, Michael Zwetschkenbaum, an analyst at International Data Corp. in Framingham, Mass., said he views the XL systems as

ITD also uses InterConnections, Inc.'s NetWare connectivity software with some of its PCs. That lets users access VAX applications in native DOS or Windows mode rather than via the terminal emulation supported by NetWare for LAT.

Still, the Novell product "is very inexpensive and straightforward," Thompson said.

Steve Williams, network administrator at Santa Clara Valley Medical Center and another NetWare for LAT beta tester, said he expects to be able to implement it for about \$500 per user in a 64-PC installation. That compares with a cost of \$900 per port using terminal servers to provide VAX access, he said.

Digital plans to ship in January a new version of its Pathworks LAN software that will allow NetWare clients to get at VAX files and print services via IPX [CW, Oct. 18]. Nearly a third of VAX sites use NetWare, according to Computer Intelligence/infoCorp figures.

ALL DECPCs					
Product	CPU	Availability	PCI*	Processor Upgrade/Config.	Processor Upgrade/Config.
XL 4320K	33-MHz 486DX	Later	\$2,899	60-MHz/51-MHz	\$1,329
XL 4640K	66-MHz 486DX	November	\$3,499	66-MHz/51-MHz	\$1,999
XL 566	66-MHz Pentium	Mid-December	\$3,999	Not applicable

Novell tightens NetWare links to VAXs, Alpha

By Craig Stedman

Trying to fill a hole in its enterprise systems line, Novell, Inc. last week introduced a new set of NetWare Loadable Modules said to enable PCs on NetWare LANS to access Digital Equipment Corp. computers through their servers.

Due to ship in December, the software implements Digital's Local Area Transport (LAT) protocol on a NetWare server. That makes the server the point of contact with VAX and Alpha AXP systems and eliminates the need to install protocol stacks on other Novell's IPX/SPX-based individual PCs.

Novell's NetWare-to-VAX software is available from third-party vendors, loading LAT or other transports of the PC level was the only approach Novell could recom-

mend to its customers until now. However, that method eats up PC memory and also requires dedicated bridges or routers within wide-area networks.

NetWare for LAT "gives Novell the DEC connectivity that it didn't have before," said Nancy Meacham, a senior analyst at International Data Corp. in Framingham, Mass.

No holds now

Mike Thompson, information systems manager at Integrated Data Technology (IDT), said PC-to-VAX traffic "is finally less" now that he no longer has to connect PCs to his VAX systems via direct TCP/IP gateways. The Santa Clara, Calif., semiconductor vendor is beta testing NetWare for LAT.

Careful, Most Of The Companies Trying To Sell You Remote Access Routers Are As New To The Market As You Are.

Experience has taught us that a low price tag doesn't mean much if it comes at the expense of functionality and scalability. That's why Cisco guarantees access without compromise. Cisco's family of remote access products is designed to grow with your network and can be upgraded at any time. So we can meet your present and future needs. Just as importantly, Cisco lowers your total cost of ownership, with exclusive features like AutoInstall, for plug-and-play access. Dial-on-Demand routing. And CiscoWorks™ which allows centralized router management of all your remote sites, even if you have thousands of them. Find out why Cisco continues to be the leader in the router market. Call us at 1-800-859-2726 for a flexible, scalable internetworking solution. After all, there's no substitute for experience. **Access Without Compromise.**

Amdahl tries to rightsize its business

By Jean S. Bozman
BURLINALE, CALIF.

Responding to continued heavy losses, Amdahl Corp. last week said it will lay off 24% of its 7,400-member work force by midyear and cancel two open systems development projects.

The IBM-compatible mainframe mak-

er has been struggling for some time to cope with the impact of sinking mainframe demand (see chart). In August, the company announced it would reorganize into five independent lines of business, creating units with separate profit-and-loss responsibility. Last week the firm restructured again — this time dropping internal development of Unix machines,

closing 650,000 square feet of manufacturing and again cutting the payroll.

As expected, Amdahl will fill the void by selling systems from other vendors such as Sun Microsystems, Inc. [CW, Oct. 25].

Some users and industry analysts see the restructuring as reactionary and too little too late. Omri Berlin, president

of Ross International, Inc. in Los Altos, Calif., called these new moves "clearly a rear-guard action" and characterized reselling Sun equipment as a "short-term solution."

John B. Jones Jr., a vice president of research at Salomon Brothers, Inc. in San Francisco, said the company put itself in its current fix by taking too long to develop its open systems strategy. "They missed the boat in being able to do it themselves."

Amdahl's latest comeback strategy is two-pronged: It will respond to IBM's next generation of mainframes with a more cost-effective design based on CMOS chips and simultaneously try to boost software and services revenue.

These new revenue streams will be

REVENUE STREAMS

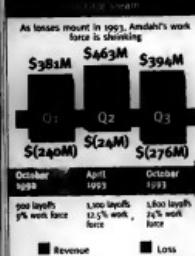

OPEN SYSTEMS

ENTERPRISE

TOTAL CONTROL

ROSS SYSTEMS

critical because CMOS chips will further reduce already tightened mainframe profit margins. The company has a long way to go in these areas, however. Mainframe services, such as maintenance and technical education, represented 17% of the company's 1992 \$2.5 billion revenue, while software sales accounted for a mere 9%.

One thrust of the new structure is providing re-engineering services, such as linking legacy mainframe systems to applications running on Unix servers.

Although Amdahl Chief Executive Officer James Zemke insisted for over a year that downsizing was overhyped, Amdahl is now finding that its installed base is moving very fast in that direction.

"This may very well be the last of the old-line mainframes we ever buy," said Peter Bauer, director of information systems at the 400-physician Marshfield Clinic in Marshfield, Wis.

The clinic just added a second Amdahl 5905 mainframe, which runs the Amdahl UTS Unix operating system, and is expanding a campus fiber-optic network with the help of Amdahl consultants. But the next generation of Unix machines may include many vendors' platforms, he said.

"I think a lot of people are in a holding pattern [with mainframes]," said Frank Stromboe, information services director for the city of San Antonio. "Moving applications off the mainframe buys us cycles as we make a transition from mainframes to client/server and Unix."

“When we rightsize with Micro Focus, we rightsizing for any platform we choose.”

Dun & Bradstreet Software has developed and supported advanced business software solutions for organizations worldwide for nearly thirty years.

With over 10,000 customers running applications on everything from mainframes to PCs, Gail Stein, a Product Manager with Dun & Bradstreet Software, needs to be sure of cross-platform portability.

“One of our corporate goals in migrating our products from the mainframe to open systems, was to have common source code across many platforms. Micro Focus allows us to create a common set of source code which enables our

Millennium financial software to run on Data General[®], Hewlett Packard[®] and ICL[®] hardware running the UNIX[®] operating system. Now when we rightsize applications, we rightsize them once and for all.”

“We see the move of the Millennium products to mid-range platforms as a cost-effective answer for customers who are currently running our products on the mainframe, and need to cut costs. It also gives them the ability to move their software from one platform to another, essentially with a seamless transition, without disrupting the day-to-day work flow of their organization.”

“Ensuring product performance and portability is an ongoing project for any software vendor. With Micro Focus solutions, we can run on any hardware we are targeting today, as well as any platform we might look at in the future.”

When the world's leading corporations demand “A Better Way of Programming,”[™] they turn to Micro Focus. For more information on putting Micro Focus Downsizing and Cross-Platform Solutions to work for you, call 800-872-6265.

Massively parallel processing

Simultaneous querying ushers in mainframe future

By Johanna Ashurst

IBM will officially start the race toward its mainframe future with the announcement next week of its first parallel processor targeted at the general-purpose market. While the machine's initial scope will be limited, it will serve as the basis for IBM's next generation of mainframes.

The machine, dubbed the Highly Parallel Query System (HPQS), will allow customers to off-load their DB2 database from their mainframe, thus saving regular mainframe horsepower for other applications. (CW, Jan. 18). The initial HPQS version will support DB2 queries only, but later models will add updating capabilities as well as other databases to the mix.

As such, HPQS will compete head-on with computers from Kendall Square Research Corp., Encore Computer Corp., Sequent Computer Systems, Inc., Hewlett-Packard Co., and the newest wares from NCR Corp. (see story page 1).

Sources said HPQS, which directly attaches to the ES/9000 family and to some models of the 9000 line, will be delivered in quantity in March. A modular architecture will support a minimum of 50 MIPS and a maximum of about 300 MIPS. Pricing is expected to be around \$18,000 per MIPS.

Separated then united

The system will come bundled with special versions of DB2, the MVS operating system and other software that allows SQL queries to come into HPQS and be broken into pieces that are given to whichever processors are available. A utility will take the DB2 data on the general mainframe and move it to HPQS. Storage devices and servers will complete the mix.

IBM spokesman did not return phone calls seeking comment, but Nick Donofrio, the head of IBM's Large Systems business, talked about HPQS earlier this year (CW, Feb. 16). At that time, he promised it would require little work to make the transition from the mainframe to the parallel versions.

It is a view that users are countering on. "We have a lot of interest in this product — if the pricing is aggressive," said James F. Satter, vice president of information systems at Rockwell International Corp. in Seal Beach, Calif.

"The key question is how easy it will be for us to move our applica-

tions." However, it is still unclear to what extent existing applications will be able to take advantage of the parallel architecture. It is also unclear to what extent users will be able to customize the machine once it is installed.

Third parties courted

But IBM trying to get third-party software vendors to support HPQS. Vendors signed up so far include Candie Corp., Oracle Corp. and Information Builders, Inc.

HPQS will likely appeal to data-intensive shops in financial services, insurance, consumer goods and other industries, observers said. Allstate Insurance Co. in Northbrook, Ill., helped IBM develop the machine; at least one other beta version of the machine is running at a site in Europe.

Jay Cassell, an analyst at Gartner Group, Inc., estimated IBM will sell perhaps 200 to 300 of the machines during the next few years. By that time, IBM will follow HPQS with other parallel models for transaction processing and other tasks. By the end of the decade, the parallel architecture will be the basis of IBM's entire family of general-purpose mainframes, Donofrio has said.

Some users are withholding judgment, at least for the time being. Doug Underhill, vice president at CSX Technology in Jacksonville, Fla., said, "The premise is if it speeds things up, it's good. But doing database queries quickly does not address whether you should be doing it. You have to have a very strong business case as well."

NCR to boost system

CONTINUED FROM PAGE 1

David Frankel, director of technology at The Smart Group, Inc., a Minneapolis-based research firm (see story at left).

While they wait, several customers said they wanted to see enhancements to the 3600, including parallel query capabilities, which they said would further entice them to remain loyal to the NCR architecture rather than shop elsewhere for future MPP systems.

Several NCR 3600 customers said they were eagerly awaiting the parallel query feature of Oracle Corp.'s Oracle 7.1 Parallel Server and Sybase's Navigation Server, both of which will run on the MPP machines next year. Delta Air Lines, one of three Sybase Navigation Server alpha testers, plans to use Navigation Server to prototype a new application for tracking baggage, gate agent information and other airport operations, said David Cochran, technical coordinator of architecture at the Atlanta-based airline.

Ready for beta

Bert Harman, vice president of product development at Sybase, said alpha beta testing of Navigation Server will begin next month with volume shipments slated for mid-1994. NCR and Sybase co-developed Navigation Server, the last of 12 System 10 products that Sybase announced a year ago.

Owen Robertson, a database administrator at Invesco Funds Group, Inc., who was among 400 customers attending an NCR briefing in San Diego last month, said his company plans to upgrade its Oracle 5.0/5.1 database to Oracle 7 by year's end to attain several new features.

For example, Oracle 7 provides shared SQL and multithreaded server capabilities, which Oracle 6 lacks. Oracle 7.1 will come equipped with a parallel query engine, a capability similar to Sybase's Navigation Server, which divides and guides queries through SQL server

databases running on parallel processors.

After various pieces of a query are broken down and sent across by the parallel processors, Sybase's Navigation Server and Oracle 7's parallel query components will reassemble the query and send a single response to the user. Those capabilities have caught Robertson's attention because his company's burgeoning decision-support systems would be able to read through data more quickly with such technology, he said.

Others see the 3600 as a stopgap along the way to the 3700. "The 3600 is going to carry us for another three to four years, so we'll see what the marketplace brings with the 3700 and other systems," said Forrest Grapes, manager of technical services at Kansas City Power & Light Co. in Kansas City, Mo.

David Barrett, a vice president of information technology at Invesco, a Denver-based mutual funds group that installed the NCR 3600 in August 1992, also said he can wait on the NCR 3700 and alternative systems. "I don't have great concerns that [the 3600] won't keep pace for some time," Barrett said.

Like other NCR 3600 customers, he said his company opted for the Intel Corp. 486-based machine because it is field-upgradable to the Pentium-based NCR 3700 and beyond.

"The 3700 will have better speed and [direct-access storage device] performance than the 3600, but I'm thinking that an upgrade is a 1995 decision since we just put in the 3600," said Mark Davis, director of data management at Union Pacific Railroad in Omaha.

To help smooth the migration to the NCR 3700, the Dayton, Ohio, computer maker this week will also announce the immediate availability of Pentium upgrades to the NCR 3600, according to Andre Dahan, assistant vice president of strategic planning and customer alliances.

Vendors are pushing Unix toward high-end machines. See story page 67.

Oft delayed

NCR's 3700 was originally slated for delivery early this year. But after announcing plans last year to delay the system to early 1994, NCR told analysts in August that shipments of the multi-threaded microprocessor-based machine would be further delayed until mid-1995.

The Pentium-based NCR 3700 has been delayed to incorporate several technical enhancements, including the optimization of the Unix operating system to run commercial parallel processing applications, said Andre Dahan, assistant vice president of strategic planning and customer alliances. Industry observers, however, said that scalability rather than the availability of the highly parallel systems has contributed most significantly to its delayed debut.

"Most companies with MPP systems to-

day are only running dot-com or dot-mud, a few hundred parallel processors," said David Frankel, director of technology at The Smart Group.

"The need for an MPP system with thousands of processors, such as the 3700 will have, isn't really there yet," Frankel added. Agreeing with Frankel, NCR 3600 customers interviewed last week said they have only just begun to harness the processing power of their machines and probably will not be ready to upgrade to a 3700 before 1995.

Meanwhile, NCR continues to optimize the performance of the NCR 3700. When the machine is delivered, it will be price/performance competitive with forthcoming MPP machines to be introduced in 1995 by IBM (see story at left), Unisys Corp. and other vendors, according to Robert G. Stango, executive director at International Technological Group, a Los Altos, Calif., market researcher.

Will 'fast LAN' technology thrive on its own?

By Joanie M. Wender

Even as the first 500M b/sec. Ethernet products from Grand Junction Networks, Inc. start hitting the streets today, the future of the so-called "fast LAN" technology will remain a question mark.

It is not clear whether the pumped up LAN technology, which preserves entrenched Ethernet investments in expertise, router ports and protocol analysis tools, will wind up functioning primarily as a pre-Asynchronous Transfer Mode (ATM) bottleneck-reliever or thrive as a LAN in its own right.

"Users are confused; they're not sure which 'standard' they have," said Todd Dugres, vice president of communications research at The Yankee Group, a Boston consultancy. He was referring to competing fast LAN standards from two camps, one led by Grand Junction and the other by AT&T/Puerto Rico.

Meanwhile, Ardis Corp., a semiconductor firm in San Jose, Calif., has been a beta site for Grand Junction's products for about a month, using them to alleviate server traffic jams. The installation comprises Grand Junction's FastSwitch 10/100 switching hub, which supports

many dedicated 10/100M b/sec. Ethernet links, two dedicated 1000M b/sec connections and corresponding FastPCI 100 Extended Industry Architecture adapters in the servers.

The scenario allows Ardis to dedicate 10M b/sec. to certain workstations using existing adapters and to deliver 1000M b/sec. to the off-tapped servers, effectively tripling the amount of bandwidth available, Atsuel said. This scheme is "cheaper than trying to get FDDI interfaces into all the servers," said Tom Ogle, director of engineering.

FDDI, or Fiber-Distributed Data Interface, is a fairly established 1000M b/sec. LAN. Internally, cards hover around the \$1,000 mark, however, whereas the Grand Junction cards cost \$300.

While 100M b/sec. Ethernet is in its infancy in the standards process — the Grand Junction version is being submitted to the Ethernet standards body this month [CW, Nov. 1] — standards didn't play so much of a role here, "given the high-speed links are confined to a fixed number of centralized servers," Gilbreath said. He said the role of 1000M b/sec. Ethernet is uncertain in his firm. "It could change to ATM, this will hold us a few years till we see what develops."

Users aren't sure which standard they should buy,
according to **The Yankee Group's Todd Dugres.**

API wars

CONTINUED FROM PAGE 1

over wired or wireless communications services they choose, she said.

However, competing activities, including an expected initial demonstration of Motorola's Mobile Networks Integration (MNI) specification at next week's Comdex/Fall '93 show (see box below), could eventually hinder wireless use if efforts do not coalesce before wireless demand ramps up.

Incompatible interface methods mean that "some applications built for one network may not be available on another," said David Coursey, editor of the "P.C. Letter" newsletter published in San Mateo, Calif. That, in turn, could impinge on horizontal, widespread wireless-enabled application use, he said.

On the other hand, as in the case of Ericsson's initial project, "vertical man-

kets don't care," he said. They pick a protocol, often which is best suited for their application, and that's it. He predicted that wireless use will stay largely vertical — or at least confined to a finite population of users — for several years to come.

Indeed, Chevron Information Technologies Co. in San Ramon, Calif., is currently content to use just RAM Mobile Data's network services, said Dale Reed, a personal systems analyst. "So for development purposes, we'll stay with application interfaces that work on that carrier," Reed added.

Network enabler

MNI, announced last spring [CW May 3], is an API that is currently effort by Motorola to develop a broad-based industry standard. The spec allows developers to access network-enable message-based applications for a variety of wired and wireless networks with one interface. Initial products were due in the third quarter but have slipped to first-quarter 1994, a Motorola spokesman said.

Slated to allow developers to add hooks into Ardis, RAM, Cellular Digital Packet Data (CDPD) and paging networks, MNI will be an alternative to RAPI. And yet a third spec is under construction by Intel Corp. for a consortium called the Asynchronous Protocol Standards Alliance.

Analysts said they expect other vendors, such as AT&T with its MacGage Cellular Communications, Inc. interest, to also hop on the API bandwagon with their own specifications.

Paging APIs!

Expected announcements from Motorola and Comdex/Fall '93 next week include the following:

- First application rollouts and partnership announcements for its Site Message product (ICW, April 19), which allows mobile workers with alpha phones to download E-mail, calendaring, PC-based faxes and other data when away from their desks or offices.
- First live demonstration of its MNI specification, which allows developers to write applications that interface to Ardis, RAM Mobile Data, CDPD and paging networks.
- Enhancement of the Flex paging protocol to boost paging network throughput from 2,400 to 8.6K b/sec.

Reporter's

Notebook

Speaking at E-Mail World in Santa Clara, Calif., Internet guru Elmer Steffendorf challenged users to demand from vendors the ability to send messages intact across all their systems.

Today's solution of using electronic-mail gateways that translate messages into different formats creates very serious problems when the translations go awry, which they often do. "We don't want letters that are opened by the post office and rewritten for us," said Steffendorf, a principal at Network Management Associates.

Nathaniel Borenstein, a member of the technical staff at Bellcore, echoed this

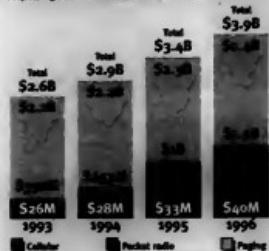

challenge in his session on the future of messaging but added a warning to vendors: "Don't let us down, try to remember the message in the envelope base." The problem with X.400 was that it was designed to replace everything, he said.

In the present, users on the show floor crowded over a personal scanner and related Windows and Macintosh software from Visioneer, a software start-up in Palo Alto, Calif. In demonstrations, the 449 scanner, which is a little larger than a roll of aluminum foil, scanned a one-page document with graphics in six to eight seconds. The software can convert the scanned images into text formats and drop the pages into E-mail and computer-based fax software. "It's the other half of fax software because you don't have to create documents on the PC in order to fax or mail

Wireless winners

The death of these hacking a standard API for a given wireless technology could affect the use of that network type.

Projected global wireless data network services revenue

Source: Inktel Research Corp., Uniphase, R.I.

The uptake of multiple APIs is busy with all contributing efforts considered in the same light, competing APIs would "bring forth the best-performing solution for end users," said Robert Rosenberg, president of Insight Research Corp. in Livingston, N.J. This is because developers could evaluate and choose an interface's technical merits, he said.

The problem, Rosenberg said, is that "the playing field is not level, and vendor cloud will certainly play a factor when independent software vendors choose their API."

The \$250 RAPI kit is available for DOS PCs, and versions for the Hewlett-Packard Co. HP100LX palmtop, Windows PCs and Apple Computer, Inc. PowerBooks are due to ship in the first quarter of 1994.

In the meantime, the APS alliance, which includes Intel, Isocor, Microsoft Corp., Apple, Advantech and other vendors that agreed to work together on the standard (in October), has not yet set a date for a draft specification, according to a member of the alliance.

them around," said one attendee, who was equipping his organization's newsletters with the devices.

A partnership between E-Mail integration powerhouses SoftSwitch and Hewlett-Packard had less clear-cut benefits. The duo said they will co-market their X.400-based messaging products. SoftSwitch's multiprotocol EMX switch and HP's OpenMail. While SoftSwitch's product lacks message storing capabilities and HP's lacks multiprotocol support, their product lines compete in many other ways, analysts said. The companies said one benefit is that HP's OpenView network management system could be used to manage both platforms, but they did not provide details or time frames for the

NT to blend in X.500 directory services

CONTINUED FROM PAGE 1

One of the problems with running multiple server networks lies in synchronizing the messaging directories. If Microsoft implements X.500 correctly, the NT server should help do that and should interface well with other vendors' X.500 directory products, he said.

If it leases Siemens' X.500 code, Microsoft will assure itself of compatibility with the emerging industry standard. It was Siemens' X.500 submission that was accepted by the Open Software Foundation for inclusion in its Distributed Computing Environment (DCE).

Siemens was unavailable for comment at press time.

Head start

IBM has already announced that LAN Server will ship with DCE, which inherently means it will work with X.500. IBM has already shipped LAN Server client software that works with DCE and is expected to ship a DCE-compliant server portion soon.

While Novell's NetWare 4.x series also provides directory services, the services are not based on the X.500 standard.

"The importance of this is that Advanced Server starts to deliver parity with the network operating systems already in place from Novell and Systech," said Frank Duzeck, president of Communications Network Architects, Inc., a consultancy in Washington, D.C.

Microsoft is not likely to make the technology commercially available in Advanced Server until the next update of the product, which is slated for sometime

next year. While Microsoft could deliver it as an add-on to Advanced Server, most observers predict Microsoft will wait so it can move tightly weave it in.

"If they make it an add-in, it would be defeating the purpose of some of the product's advantages. No other vendor has tried to just plug it in," Duzeck said. However, even with the addition of so-

plicated directory services, some users said they would not view NT as an enterprise-wide solution because of its immaturity.

"We'll probably use it more as an application server," said Brian Morris, an assistant city manager in San Carlos, Calif., a NetWare site.

Although Microsoft officials declined to comment on the company's X.500 plans, one executive acknowledged the company's interest in directory services.

"We want to ensure that NT is the ultimate open platform, and we are certainly looking at X.500," said Dan Shelly, a Windows NT product manager.

Microsoft has said its forthcoming Enterprise Messaging Server will support X.500 directory services, but it is unclear how that will be done. One logical option is that Enterprise Messaging Server will operate as a module on the NT Advanced Server and that it will use the server's directory services, analysts said.

Client/Server Database Solutions

It's available now—ready to perform on your desktop. A new function-rich, 32-bit relational database you can really trust with your growing client/server network, your mission-critical data and your business.

Introducing IBM DATABASE 2™ OS/2® (DB2/2*) from IBM Programming Systems, the birthplace of relational database technology.

DB2/2 includes an industrial-strength DB engine that supports transaction management, concurrency control, security, integrity, and recovery functions. Designed to exploit the power and open architecture of OS/2, it also supports industry-standard SQL for developing portable applications. And it runs your DOS, DOS Windows™ and OS/2 applications requiring online access.

You can access data directly from DB2/2 on your desktop or from a DB2/2 server on your LAN, and with

DISTRIBUTED DATABASE CONNECTION SERVICES/2™
from DB2, SQL/DS*, and OS/400®
databases as if they were on your desktop, too.
This versatility can play a significant role in
an Information Warehouse™ solution
for your business.

We've developed an

DB2 goes desktop.

exciting demo diskette to show you just how well new DB2/2 performs—right on your desktop. Call us today for your free demo, or to order DB2/2:
1 800 342-6672; or fax: 1 800 445-2426.
In Canada, call 1 800 465-7999, ext. 850.
An upgrade from OS/2 Extended Edition or Extended Services is also available.

management capabilities.

Another HP partnership promised to allow OpenMail users to exchange messages, documents and binary files with IBM mainframe and OS/400 users. LinkAge, Inc., in Ottawa will provide the gateway software that will enable these functions, beginning in the first quarter of 1994.

Meanwhile, Z-code Software in San Rafael, Calif., announced a new version of its Unix-based E-mail that uses the Multipart Internet Mail Extension (MIME) standard. MIME allows multimedia messages to pipe through the Internet uncalled. Uniplex in Cambridge, England, demonstrated its new Unix-based E-mail software that uses MIME and Microsoft's MAPI to send multimedia messages.

News Shorts

Markey seeks more data protection

U.S. Rep. Edward J. Markey (D-Mass.) last week introduced a bill called the Telephone Consumer Privacy Protection Act, which would prohibit the disclosure of telephone transactional data, regulate Caller ID services and establish a "bill of rights" for telecommunications privacy. The bill also would require businesses that use automatic number identification to inform consumers when they reuse or sell information gleaned from those services.

Compaq unveils midrange, other PCs

As expected, Compaq Computer Corp. rolled out 45 desktops this week, including a midrange line called the DeskPro XE based on Intel Corp.'s Pentium microprocessor [CW, Nov. 1]. Compaq also announced price cuts of up to 12% on its Prolinea line and 25% on Pentium versions of the DeskPro/M. Pricing for the lines will now start at \$1,149 and \$4,099, respectively. The Houston company also announced a new price point of \$4,399 for its Compaq Portable 486/95 notebook.

Unisys to boost client/server emphasis

Unisys Corp. is slated today to roll out 10 PB2 Advantage Series PCs and six CTOS client/server systems featuring Intel's奔腾 Processor and Energy Star compliance. Also set to debut is software designed to provide tighter integration between Unisys' Unix-based U8000 Series systems and mainframes running IBM's SNA. Unisys also announced plans to integrate Windows into its CTOS architecture in the first half of next year.

Sybase employee charged in theft

Oracle Corp. has filed a civil complaint against a Sybase, Inc. employee, alleging theft and possible misappropriation of trade secrets. William Brumiller was arrested in late September for allegedly stealing hardware and software from Oracle's Redwood Shores, Calif., offices. Brumiller was a programmer at Oracle until June, when he joined Sybase's Gain Technology application development tools unit. An investigation of Brumiller's home turned up a PC, disk drives and several other items reported missing from Oracle both before and after Brumiller went to Sybase, according to Joanna Sherman, senior corporate counsel at Oracle. A search of Brumiller's office at Sybase, witnessed by both Sybase and Oracle representatives, found no proprietary Oracle information at Sybase, spokeswoman from both firms said.

SHORT TAKES Microsoft Corp. has announced a program to allow developers each quarter to automatically receive the company's Development Platform package, which includes current versions of MS-DOS, Windows, Windows for Workgroups and Windows NT as well as all of Microsoft's software development kits necessary to create Windows applications. The one-year cost is \$95. Mail-order PC maker Zeeus International Ltd. in Minneapolis and CompuAdd Corp. in Austin, Texas, said they are discussing a possible business combination.... Kens, Inc. in Boston has signed a letter of intent to acquire systems consultancy AGS Computers, Inc. from Nynex Corp. in White Plains, N.Y. In the largest theft of computer chips to date in the U.S., masked armed robbers stole \$2 million worth of computer chips from an Okil Semiconductor plant in Tualatin, Ore. On Dec. 1, Hewlett-Packard Co. will launch an express financing and leasing program through which computer customers receive a financing division within 24 hours.... As expected, Kendall Square Research Corp. announced the KSR-2 parallel computer with up to 5,000 processors.

Portables**Toshiba shrinks notebook line**

By Stephen P. Klett Jr.
and Michael Fitzgerald
EWINE CALIF.

Attempting to prove that great things can come in smaller and smaller packages, Toshiba America Information Systems, Inc. is expected today to unveil a subnotebook line sporting features previously found in the company's full-size brethren.

Toshiba's Portege T3400CT is powered by an Intel Corp. 33-MHz i486SX and features an active-matrix color display and a three-hour battery life in a 4.4-pound package. A monochrome version weighs 4.1 pounds and has at least a four-hour battery life, according to Toshiba.

The relatively long battery life comes in part from lithium-ion battery technology, which Portege is the first portable to use. It is also the first subnotebook-class machine with local bus graphics, including a built-in Western Digital, Inc. Rocket graphics chip.

"They've come out with a well-engineered product," said Bruce Stephen, an analyst at International Data Corp. in Framingham, Mass.

Portege incorporates a single PCMCIA Type II slot and a version of the TrackPoint II pointing device built into the IBM PC Co.'s ThinkPad. Bundled with Traveling Software, Inc.'s CrossWorks, a monochrome version will ship in January for \$2,599; a color model will ship later this month for \$3,999.

Analysts said the new products will help Toshiba retain its posi-

tion as the No. 1 notebook vendor worldwide in the face of ferocious competition. For example, Epson America, Inc. is reportedly readying a 486-based notebook for display at Comdex/Fall '96, and Hewlett-Packard Co. will announce a

such as Zenith Data Systems' Z-lite, IBM's ThinkPad 500 and HP's OmniBook, all of which start at roughly \$2,000 and weigh less than 4 pounds. However, Toshiba officials said they are banking on users' need for more functionality.

"Wow! It really sounds like they have a killer machine here," said William L. Lodge, project director at Turner Corp., a multinationals construction company in New York. Lodge said he has received ThinkPads and has already much given up on receiving them in quantity because of IBM's delivery woes and reported battery problems (see story below).

Alex Zlotnick, assistant director of marketing systems at Random House Publishing, Inc. in New

York, is also interested. "Before Toshiba, we were looking at the [ThinkPad] 500C, which looked nice, but you can't get it," Zlotnick said. He said Random would consider Toshiba and Epson.

Power shortage

Advice to users waiting for back-ordered ThinkPad 500Cs: Don't hold your breath.

IBM has apparently pulled the plug on production of the subnotebook due to technical problems with the battery, according to a spokesman.

The 500 has a new lead-based battery technology designed to provide longer life and easier recharge at a lighter weight than conventional batteries. The spokesman said several customers reported that the battery lost its charge very quickly. Some machines lost power immediately after they were turned on.

IBM plans to announce a fix in two weeks. It could come in many forms, including a produced recall or shipment of new batteries to customers.

"You'll see the 500 back soon," the spokesman said. "This is not a situation where the model will be canceled. It's a temporary holt."

Borland takes on Microsoft

By Melinda-Carol Ballou

BORLAND INTERNATIONAL, a stab at rival Microsoft Corp. next week when it announces its C++ 4.0 development environment for Windows and DOS. Borland expects to ace Microsoft by providing support for 16- and 32-bit application development for Windows within the same tool set, as opposed to requiring developers to purchase separate tools for both environments — as Microsoft does.

One tool kit will simplify migration to Microsoft's Windows NT and upcoming Chicago environments, Borland officials claimed. While Microsoft offers separate tools — Visual C++ for 16- or 32-bit development priced at \$599 each or \$749 for both — Borland will of-

fer an integrated 16- and 32-bit C++ environment for \$499.

Next month, Microsoft reportedly will release its Visual C++ 1.5 and Microsoft Foundation Classes 2.0. The company says it will seek to ease the pain of Object Linking and Embedding (OLE) development by offering libraries for OLE 2.0, along with Object Database Connectivity support and other features [CW, Oct. 25].

Borland hopes to deliver OLE 2.0 support in its Object Windows Library (OWL) early next year.

Major improvements to OWL 2.0 include a set of predefined visual objects, source-code compatibility between 16- and 32-bit versions and high-level controls. C++ 4.0 features include new visual programming tools, exception handling and templates.

When It Comes To Client/Server Computing, Think Big. Start Small.

EDA/SQL From Information Builders. The Data Access Standard For Client/Server Computing That Grows With You.

MAKING THE MOST OF YOUR ASSETS

Data is one of the most strategic assets any business can have. Because businesses that utilize data well, will succeed. Businesses that don't, won't.

The trick is knowing how to use your data resources in the most cost effective way.

That's where Enterprise Data Access/SQL (EDA/SQL) as a client/server solution can make the difference.

OPENNESS, POWER AND FLEXIBILITY

Implementing client/server applications can be tough, particularly when you need to access remote data on diverse platforms.

With EDA/SQL you have the freedom to access data in over 50 different databases and files, running

on 35 computing platforms using any major network protocol. And there are dozens of applications and tools available from more than 50 leading software vendor partners that support EDA/SQL.

No other SQL solution on the market gives you this much flexibility.

BIG OR SMALL, IT'S ALL THE SAME

EDA/SQL has the power and the ability to drive the largest enterprise-wide implementation, or to simply connect a single client/server application to a specific data source.

And because there's an EDA/SQL solution for every popular platform, and network protocol, you can use it in the environment of your choice.

Only EDA/SQL has the scalability and configuration flexibility to meet your client/server requirements both today and tomorrow. You can start with the EDA/SQL solution you need today. Then, efficiently and economically grow any configuration to meet your changing business requirements. Big or small.

For more information on EDA/SQL, our consulting services and education programs, or to attend a FREE Seminar...

Hayes Delivers The High-Speed Global

OPTIMA[®]
288

HS AA

Introducing an incredible breakthrough in dial-up modem technology. A modem so fast it will exceed your expectations now and in the future. Introducing the OPTIMA™ 288 V.FC™ + FAX.

Instantly Compatible. The OPTIMA™ 288 incorporates the *V.Fast Class™* 28,800 bit/s technology developed by Hayes and Rockwell International. The same technology that's being

supported by more than 125 other modem manufacturers worldwide as the new industry standard for high-speed performance. The OPTIMA 288 not only communicates with other *V.Fast Class* modems, it will work with future Hayes modems incorporating the ITU-T V.34 (V.Fast) standard. And, it communicates easily with your installed base of 14,400 and 9,600 bit/s modems.

Faster Than You Think. You might expect a 28,800 bit/s modem

\$579
Estimated Retail Price

Four Times Faster Than

to transfer compressed data at 115,200 bit/s. With the enhanced technology of Hayes, you can expect *farce* that speed. OPTIMA 288 supports port speeds up to 230,400 bit/s and transfers graphics files at 200,000 bit/s. And, it's considerably faster and less expensive than switched 56 Kbit/s. Our OPTIMA 288 is especially powerful for remote connectivity to or from a LAN, remote control, transferring large files, or multi-media. You could save as much as 75% on connect charges. Plus, like all higher speed Hayes modems, our OPTIMA 288 provides the

CA ships OS/2, Windows graphical tool

By Thomas Hoffman

Computer Associates International, Inc. last week began shipping what analysts said is the first graphical development tool kit to work with Windows and OS/2.

CA-Realizer 2.0, a Basic programming environment, was designed to enable developers to write applications in Win-

dows and easily recompile them into OS/2 and vice versa, early beta users said. It is the first upgrade of Realizer since CA inherited the technology in its May 1992 acquisition of Within Technologies, Inc. Within had hoped to take on Microsoft Corp.'s Visual Basic.

CA-Realizer 2.0 combines industrial-strength application development capa-

bilities that take advantage of OS/2's 32-bit operating environment for high-level programmers while meeting the more simplified graphical user interface needs of novice developers, according to John Dunkle, president of WorkGroup Technologies, Inc., a Hampton, N.H., market research firm.

"What Realizer provides for both line-

of-business developers and more sophisticated end users is a robust set of tools," Dunkle said.

"It's the best development tool I've used," said Joseph A. Tibollo, manager of PC development at Back Information Services Ltd., a Toronto-based data service provider to the aviation industry.

Less chance for error

Tibollo said he found it easier to develop applications using CA-Realizer 2.0 than Microsoft's Visual Basic or Borland International, Inc.'s Paradox programming environments because CA-Realizer requires fewer lines of code to write applications, thus reducing the risk for errors.

Tibollo said that in his testing since January, CA-Realizer 2.0 has outperformed Visual Basic and Paradox in several areas, including debugging and data arrays-handling capabilities. For example, Tibollo said CA-Realizer can manage 64K-byte "strings" of data arrays, a function Visual Basic does not provide.

CA had planned to ship a Windows-only version of CA-Realizer 2.0 in June but decided to hold off to integrate cross-platform

DON'T PAY FOR SOFTWARE NO ONE IS USING

Are you paying rental or maintenance fees for MVS mainframe software you're not using anymore? Are only a few people using a product that takes a lot of time and effort to support? Do you have software on diskettes that you can't seem to find again?

SoftAudit answers all these questions automatically! Without interfering with normal operations, SoftAudit tracks and logs every execution of every

load module on your MVS system, no matter how it's loaded.

With its extensive knowledge base, SoftAudit recognizes the products you have installed (both IBM and non-IBM), and tells you where they are, and how often and by whom they're used—if they're used at all! For more information or a 30-day free trial, call Isogen Corporation today at (212) 967-2424 or...

(800) 568-8828

©ISOGON CORPORATION

SoftAudit
END THE SOFTWARE CONFUSION.

OS/2 development functionality into the Basic package, said Marc Sokol, CA's director of product strategy.

Several CA-Realizer 2.0 beta testers said it was worth the wait. "I like the ability to develop under Windows or OS/2 without giving it all up," said Chris Moore, president of Moon Consulting, a Mesquite, Texas, computer consulting and customized application development firm. Realizer "does not force me to limit my clients to one operating environment," Moore said.

Another CA-Realizer 2.0 advantage, Tibollo said, is that applications built with it can be distributed free of royalty or license fees, unlike competitive development tools such as Paradox. "If you use Paradox, you can't have multiple users for an application developed without paying a license fee. For \$60, with all the add-ons we can build, [Realizer] is free," Tibollo said.

CA-Realizer 2.0 carries an introductory price of \$600 through March 1994. After that, it will be priced at \$247.

Communicate At Breakthrough Speeds.

Get AT&T's SYSTIMAX® Structured Cabling Systems, And Get Speeds Beyond 100 Mbps.

Over copper. Or fiber. Your network can now have unprecedented speed and interoperability. All by installing AT&T's SYSTIMAX Structured Cabling Systems, with our HIGH-5™ product family of Category 5 components. They support today's network applications and emerging technologies like ATM, up to speeds of 155 Mbps. And this total solution offers you end-to-end connectivity, maximum network compatibility and the ability to evolve your network as your future needs change. All from a single,

reliable source. AT&T's HIGH-5 products exceed EIA-568 Category 5 specifications, and every certified installation includes AT&T's 15-year extended product warranty. The copper cabling was created by AT&T Bell Laboratories and has become the benchmark for Category 5 standardization testing. So find out how AT&T's SYSTIMAX Structured Cabling Systems can help you break through communications barriers. Call us at: 1 800 344-0223, ext. 3013. Outside the U.S.: 602 233-5855.

*AT&T Network Systems And Bell Laboratories.
Technologies For The Real World.*

We've Made This Trip Thousands Of Times. And Never Lost A Customer On The Way.

It's quite a ride.

The move to open computing systems is often described as traveling through permanent white water. So it's not the kind of trip you want to take without an experienced guide.

And that's where Sequent® Computer Systems can help. As both IDC and Infocorp have recently confirmed, Sequent leads the computer industry in mid-to-high end open computing systems.

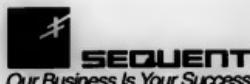

With our enterprise servers for both UNIX and Windows NT™, and our consulting and integration services, we've helped thousands of customers worldwide make the trip to open computing. We've helped companies downsize from mainframes, upsize from PC networks, and re-engineer entire computing enterprises into a client/server environment.

Over and over again, working in complicated multivendor environments, with all the complex interdependences between hardware and software, we've made sure that our customers make it safely through the white water.

That's because everyone at Sequent is 100% committed to the complete success of every installation, and empowered to deliver it. Not just for our own hardware, but for everything in the system, hardware and software, no matter who the vendor may be.

So even though there may be no way to avoid the white water, we can help make the whole trip a lot safer.

To find out more, call us at 1-800-854-0428.

Some people will try almost anything to speed up the leap to client/server.

OBJECTVIEW

In the rush to develop client/server applications, many people are going to extremes. But the smartest people are going to ObjectView®

from KnowledgeWare®. What's so smart about choosing ObjectView? For starters, unique built-in features and non-proprietary scripting options provide power and accelerated development. Superior application performance confirmed by independent tests. Workgroup development and object-oriented techniques.

Plus support, training and consulting services to guide you through all phases of client/server development.

Only ObjectView shortens time to production, leverages your programmers' current skills and delivers powerful client/server applications on any scale. Don't settle for less functional tools like SQL Windows or PowerBuilder. Compare usability. Compare code generation and performance. Compare price.

Compare support. You'll find there really is no comparison to ObjectView.

Yes! I want to learn more about how ObjectView® can put me on the fast track to rapid client/server application development. Please send me:

- Free demo diskette and product literature for ObjectView
- Information on upcoming ObjectView seminars

Client/server outsourcing

Canada Post pays as it goes

By Mark Halper

Outsourcing vendors and customers searching for a cost/price mechanism for client/server deals might take a page from the recent \$1 billion Canada Post Corp./SHL Systemhouse, Inc. contract, which established a fee structure similar to that of a monthly telephone bill.

The 10-year contract allows the Ottawa-based Canada Post to make monthly service charge requests and pay accordingly. Just like a phone customer may decide to add or discontinue a service such as call waiting, Canada Post can add or subtract software services available to any of the 9,000 PC users that SHL Systemhouse will support.

If, for instance, a department that normally has no need for a spreadsheet suddenly requires one, the client/server outsourcing SHL Systemhouse would deliver the program. It would then increase the user's monthly charge for access to one of the 1,000 LANs SHL Systemhouse is installing, a move that would factor in licensing fees.

The wave of the future?

This "fee for service" setup represents one answer to the bedeviling question of how to price outsourcing in a distributed computing environment in which the outsourcing firm is more a service provider than a data processor, Merrill Lynch & Co. analyst Stephen McClellan noted.

"That's why the way some of the client/server deals work, and it may be the way more of them go in the future," he said.

In another recent example of client/

server pricing, Preport-McMoran, Inc. and IBM's Integrated Systems Solutions Corp. devised a labor-based pricing formula [CW, Oct. 11].

"We're buying services, not hardware or people," said Roy Keating, Canada Post's director of information technology strategy. "Within defined parameters of due notice, we can order things up or discontinue service. If we decide we no longer need distributed processors in the Yukon, we can turn off those services."

Underwriting your customer

In an unusual "partnership," Canada Post is underwriting the SHL Systemhouse needs in computer and telecommunications areas. From Canada Post, Sources said the outsourcing deal would never have happened without Canada Post's financial leverage.

Keating further explained that the "due notice" varies depending on the scope of the requested change.

The deal calls for SHL Systemhouse to move many of Canada Post's operations from two of IBM's 3000 600 mainframes and onto about 400 as yet undetermined distributed computing platforms [CW, Nov. 1]. The two parties have not yet settled on a server architecture, although SHL Systemhouse said it expects to install about 4,000 LAN nodes by the end of next year.

Also under evaluation are the Unix and the Microsoft Corp. Windows NT operating systems, according to Greg Jacobsen, president of network services

at SHL Systemhouse's U.S. subsidiary.

The deal puts SHL Systemhouse in charge of the entire information utility at Canada Post, including mainframe and distributed services, networking, desktop systems and support, voice, imaging and multimedia.

Profit seekers

As a Canadian crown corporation, \$4 billion Canada Post is expected to make a profit and undertake commercial enterprises. SHL Systemhouse is expected to improve internal operations and will help move Canada Post into the electronic-mail business, which is undermining the traditional service.

On the internal side, Keating said SHL Systemhouse will first move E-mail, report writing software and database analysis and application development tools from the mainframes to a client/server scheme. That phased migration will take three years, after which SHL Systemhouse will move other programs to the distributed environment, he said.

Keating said "a very high percentage" of Canada Post's 255 information technology workers are transferring to the SHL Systemhouse payroll.

SHL Systemhouse bought most of Canada Post's information technology assets, including the mainframes and about 50 Digital Equipment Corp. VAXs, as well as Canada Post's nationwide communications network comprising Northern Telecom, Inc. packet switches, Motorola, Inc. Codex T1 and T3 packet switches and Cisco Systems, Inc. routers. Neither party told the exact cost.

tions per week, handling data processing for two Kansas City divisions. As before, it will operate on a 24-hour-a-day schedule.

In a related move, Kemper announced last week it had selected IBM Business Recovery Services as its disaster recovery provider. IBM outbid Comdisco Disaster Recovery Services, Inc. and Sungard Recovery Services, Inc.

Until now, Kemper has handled backup/recovery in-house, using its Kansas City center to back up both its Chicago center and a smaller site in Milwaukee.

When the Kansas City center was built five years ago, "there was really no good backup scenario" from outside disaster recovery firms, Diaz said. No external service provider, he explained, was able to support Kemper's need for recovery of its mission-critical applications within an hour. But updates in IBM's VM system software have made it more flexible from a disaster recovery standpoint, he said.

However, fully outsourcing the data centers to an outside firm is not in Kemper's immediate plans. Diaz said, "I don't see ourselves getting rid of our data centers." He described his 200-person information systems shop as "already very lean."

"Basically, [no outsourcing proposal] has come closer to us in staffing or cost per CPU," he said.

Kemper melds data centers, picks IBM as backup vendor

By Ellie Bookler

Kemper Corp. last month completed a two-month data center consolidation that not only closed its Chicago center and moved its contents, including an IBM ES/9000, into its Kansas City, Mo., facility, but also involved relocating its networking center.

Kemper had a IBM 9021 Model 580 in Kansas City and a 3090 Model 000J in Chicago. Both have been replaced by a two-processor ES/9000, which has been logically split to run the existing software code. The operating system on the ES/9000 is MVS/CICS.

The moves are expected to result in an immediate net savings of about \$1 million for Kemper Service Co., which provides data processing and other services to its business units.

But there will be greater, noncomputing-related savings down the road, according to Frank Diaz, president of Kemper

Service. His unit has an annual budget of about \$140 million.

The move was prompted by several additional factors, including Kansas City's lower taxes and real estate costs and the fact that Kemper enjoys lower local telecommunications costs in Kansas City, where it has a fiber bypass network. Kemper's network center was also shifted to Kansas City.

Not a people mover

Networking, in fact, played a significant role in the data center consolidation. For instance, thanks to the extended channel capability of the ES/9000 mainframe in Kansas City, Diaz was able to keep most of his technical staff in Chicago. "It really became more of an equipment than a people move," he said. The staff in Chicago will use local consoles to log on to the host in Kansas City.

The consolidated Kansas City center will process more than 4 million transac-

You are witnessing the birth of a new age.

And this is the power behind it.

Meet the first PowerPC-based RISC System/6000.

It's more than an introduction. It's a revolution. The price/performance leader of UNIX® systems—IBM's RISC System/6000®—has joined forces with the most exciting chip ever created—the new PowerPC 601™—to create the POWERstation™ 250. The 250 sets a new standard for entry performance—and price/performance. For your business, it means answers at lightning speed, from accounting to engineering to application development. In fact there are thousands of proven Applications for the commercial-strength AIX/6000™ operating system. We're also delivering the first

complete DCE for advanced client/server solutions. And we've brought technologies like multimedia and object toolkits to the RISC domain. With Wabi,™ you'll run Windows™ applications at blinding speed. Macintosh programs too. And there's more. We're also launching POWER2™, the industry's most powerful RISC technology, in the new POWERserver™ 990—delivering unprecedented processor performance.

The future will see PowerPC and POWER2 technology in everything from notebooks

to supercomputers. If you're ready for a real change of pace, call us at 1 800 IBM-6676, ext. 669 today.

RISC System/6000

Power for a new age.

IBM

Integrated PCs gathering steam

CONTINUED FROM PAGE 1

simplified system upgrades. It may also mean that due to the improved reliability of chips, PCs will need less support and maintenance, which today constitute a high percentage of a PC's overall cost.

Also, built-in sound and SCSI could in turn prompt a surge in the use of CD-ROM drives and perhaps multimedia PCs.

Helping nudge this trend even further along is the Plug and Play initiative backed by Intel Corp., Microsoft Corp., Compaq Computer Corp. and Phoenix Technologies Ltd. The outcome of his initiative is to make configuration of a range of I/O components and subsystems with operating systems easier and significantly less expensive (see story below).

"The more standardization there is on the motherboard...the better and the easier it is for corporate IS," said Andrew M. Seybold, editor in chief of "The Outlook on Professional Computing" newsletter in Brookdale, Calif. Seybold also cited the historical trend toward integrating add-in cards that have achieved a critical mass.

Everex climbs back

Everex finds itself ahead of the market in desktop design with its Step Plus family, which features integrated motherboards. The question is, can it make the most of it?

First, as Everex surges the crest of the integration wave, the competition is padding seriously to catch up. Most vendors have started to build more functions onto motherboards, and the rapid pace of development cycles has led most analysts to give Everex at best a six-month window on the market.

Having just emerged from Chapter 11 bankruptcy protection, the company knows it must first convince users it is a viable firm with a viable product. Then it has to prove it has the manufacturing capability to produce the product.

If it has problems manufacturing its new line, its window of opportunity could probably slip to four months. Everex cannot afford an exodus with the backlog problem that has plagued market leaders like Compaq.

Everex acknowledged the obvious: Its future rests on how the market receives the Step Plus. "We know we probably only have one shot at this, so we had to make it good," said Chat Doyal, senior product manager of desktop systems at Everex in Fremont, Calif.

Everex acknowledged it will likely need additional manufacturing capacity, which it said it expects to find, though it declined to say where.

—Michael Fitzgerald

Companies such as Compaq, the IBM PC Co., Hewlett-Packard Co. and Zenith Data Systems kicked off the trend by shrinking systems built-in networking, sound, graphics acceleration and even PCI/ISA support on the system motherboard.

The PC Co. will soon add an MMwave digital signal processor to P52/ motherboards and give P52/ buyers the option to have Ethernet or Token Ring built into the motherboard as well.

"If you're trying to serve the general market, putting it on the motherboard gives you better reliability and lower costs, and that's what you want," said T. S. Jen, senior technical analyst at the PC Co. Jen cautioned that the PC Co. will likely handle integration differently in its various product lines.

Other offerings

Compaq's newly introduced DeskPro XE line has built-in sound [CW, Nov. 1], and even the new portables from Toshiba America Information Systems, Inc. have built-in graphics acceleration.

But these vendors have limited their integration efforts to certain models and certain features.

Hoping to leapfrog the competition, Everex Systems, Inc. will today announce its Step Plus line of desktops, which come standard with Ethernet, sound, SCSI-2, integrated drive electronics (IDE), I/O and graphics acceleration on the motherboard.

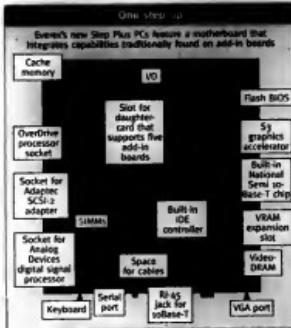

In a nifty design twist, users can configure the system more or less how they want it. While IDE, graphics acceleration and I/O are built-in, users can choose whether they want networking, sound or SCSI. Sound and SCSI are handled via on-board sockets that allow users to pop in the processor of their choice. An intelligent BIOS automatically senses what components are on the machine and configures it appropriately.

Must-haves

With the preponderance of networked PCs that now support graphical software, providing networking and video acceleration are generally a must. On-board SCSI means users can easily add SCSI peripherals such as CD-ROM, built-in sound allows them to build in multimedia support as it becomes more prevalent. Also, digital signal processors can be programmed to work as modems.

"That's a neat trick — it's a surprisingly innovative design, especially since it's configurable," said Dean McCarron, analyst at Micro Design Resources in Scottsdale, Ariz. He said Everex will take the integrated PC concept further than other vendors at Comdex Fall '96.

Motherboards with various functions integrated on them now appear to be an inexorable trend, according to observers such as Giusto. "This is a solid trend — desktops are inherently

leapfrog products, and you can bet that soon as this is out, the other vendors are going to do it and try to do more," Giusto said.

Corporate users applauded the trend but said vendors must give them the flexibility to gain features without losing current add-in investments.

"Putting it all together makes sense if you can get the overall price down, simplify things and get it into a smaller package," said Robert McLoughlin, assistant vice president of PC procurement at New York Life Insurance Co. He also said integrating technology on the motherboard should eliminate the troubleshooting nightmare caused by add-in boards that have come loose or lack driver support.

Adding functions to the motherboard cuts not only direct costs for end users but indirect costs as well. For example, manufacturers can make smaller systems, which in a highly competitive market such as desktop PCs means lower prices for end users.

Also, users are expected to realize higher savings from reduced labor costs and fewer configuration problems. Consider that for every feature built into the motherboard, a PC manager does not have to assign personnel to rip the old PCs to add cards. According to many consultants, the lion's share of a PC's true cost comes from labor and other costs.

Gartner Group, Inc., in Stamford, Conn., estimated that a single PC costs roughly \$2,000 a year to administer and support.

Abraham Chait, project manager at Pacific Gas & Electric Co. in San Francisco, agreed that on-board integration of system components has typically meant lower costs and smaller footprints. While increased levels of integration are "a fantastic idea," Chait said he was worried about potential replacement costs.

"The downside is what it costs to replace the motherboard after warranty," Chait said. Adding features to the motherboard means that the motherboard may have to be replaced if a component goes bad, he said, adding that would be painful, especially if a component replacement costs fall under \$1,000 after warranty.

Senior editor Ed Scannell also contributed to this article.

New models

Everex's Step Plus models include the Value Edition

Everex's Value Edition is a fully loaded configuration with奔腾处理器。

Everex's Corp.'s Atlantic networking chip, SCSI-2 and sound included. System memory ranges from 512KB for a \$2,499.99 model to

\$2,599.99 for a 33MHz 486 with 8MB RAM, without hard drive.

Everex officials and analysts said this would save users of least 20% more than buying add-in boards, plus have more space.

For instance, the Aztec 2000 model chip costs \$10, compared with Creative Devices, Inc. Soundblaster Card, priced at \$49.99.

Switched on

Last week, the Plug and Play coalition, now backed by 20 companies, delivered the final specification for its BIOS. The spec is a set of instructions embedded in PCs that will make it easier to configure and install more advanced system designs.

Microsoft said its first operating system to take advantage of the spec will be the next version of Windows, expected in the second half of next year. The first PCs to take advantage of the Plug and Play BIOS spec should reach the market early next year.

"The final Plug and Play specification brings us a lot closer to resolving device conflicts and making PC configurations hassle-free," said Dale Bucaliso, vice president of research and development at Phoenix Technologies. —Ed Scannell

What do you need before you buy

a bridge or router, a gateway,
emulation software, a MAU,
intelligent hubs, token ring adapters,
protocol converters, or wiring products?

An Answers Machine.

Sure, we could sell you any one of these network elements. All of our proven, reliable products do an excellent job of integrating your LAN, midrange, and mainframe systems. In fact, we are one of the only vendors who combines LAN

Answers and midrange/mainframe expertise as our primary focus. But it's our experience providing from downsizing and rightsizing solutions for customers around the world that really separates

Andrew us from other multiplatform network vendors.

After thousands of installations and many industry awards, we know how to solve your problems. Isn't it time you got the answers you need? For a free Network Planning Guide, call 800-328-2696, x263. Or call 708-349-5440 and ask for an Andrew Answers Machine.

INTRODUCING THE COMPAQ SO MUCH FOR THE THEORY IF

Other companies wait until after your server breaks to fix it. At Compaq, however, we understand the importance of safeguarding your mission-critical applications. Which is why we back all our ProLiant servers with a combination of support technologies and services that can anticipate problems and prevent them from occurring. The most unique of which is our Pre-Failure Warranty. Here's how it works. If

a memory or drive component drops below a pre-established level of performance, your ProLiant will alert you. That way, memory and drives can be replaced before a potential failure occurs. For free. Because the components are covered by the Compaq 3-year, on-site* warranty. And if you want to make it really easy on yourself, you can configure your system to notify a CompaqCare System Partner, who will send a highly

Q PRE-FAILURE WARRANTY. IT AIN'T BROKE, DON'T FIX IT.

constantly monitors the health and performance of your server. So a small problem with a drive doesn't get the chance to become a big problem with your network.

As if all that weren't enough, we even back our servers with free, round-the-clock phone support, every day of the week. And we offer optional Advanced Network Support Agreements, which include both comprehensive operating system and third-party hardware support for your entire network. What's more, you'll have the option of subscribing to QuickFind, a CD-ROM resource for supporting Compaq-based networks, which is proactively updated on a biweekly basis. All of which should make you feel even more confident about choosing Compaq as your network server platform.

To receive information about the unique dependability and support features of the ProLiant, call 1-800-345-1518. Choose PaqFax and order document number 4253 or 4255. We think you'll agree, the best way to protect your mission-critical applications is with a ProLiant. After all, ignoring a problem won't make it go away.

COMPAQ

skilled network technician to your office to fix your server for you. So you can avoid downtime and lost data. Not to mention anxiety about running your mission-critical applications.

And you won't get this kind of assurance from any other computer company. In fact, only Compaq can offer you a Pre-Failure Warranty, because only Compaq servers have Insight Manager, an innovative software tool that

Multimoola

Next week is Comdex, the big tamale of all computer trade shows and the one the industry looks to for the trends to watch in the coming year. You can bet that one mega-theme this year will be multimedia.

That's not surprising. The incredible shrinking margins in hardware and software have vendors groping for a reason to get users to spend more money. A lot of them see salvation in the eye-popping investments computer and communications firms are making in interactive multimedia.

So maybe now is a good time to think about how multimedia is going to affect you, the IS professional. It seems like every vendor I meet lately has a plan for incorporating multimedia into its products. But who asked to define how costly capability is going to be used, they always mention the same examples: computer-based training; sales presentations; airport kiosks; maybe some user interface stuff.

Hardly the stuff of which revolutions are made. For all the excitement about multimedia, I've still seen precious little justification for its high cost. And it is expensive stuff.

For multimedia to make any headway anywhere outside of games and training, the infrastructure in corporations and in communities will have to be improved drastically. We're talking decades to do that. It took cable TV more than 30 years to reach 70% of American homes. How long will it take corporate America to upgrade to one of the new high-speed technologies that supports multimedia? (Hint: Don't hold your breath.)

And who's going to create all these multi-presentations? There's a dearth of multi-authoring software out there that doesn't require an investment of \$10,000 or more. Corporations are not going to spend the bucks to train business professionals to be amateur television producers. Nor will they shell a lot of money into building multimedia production departments unless the payback is clear. Which it isn't.

And consider support requirements. The last thing corporate IT wants to tackle right now is maintaining a complex, multiplatform network shooting sound and video files to the far reaches of the world. Heck, I'm still struggling to get my SoundBlaster card to work with most of my stand-alone Windows applications. Multimedia requires far more powerful hardware and communications capabilities than most corporations can muster today. The upgrade costs will be staggering, but they'll pale in comparison to the support problems.

I won't even mention the copyright issue.

If you're going to Comdex next week, prepare to be impressed by the dazzling multimedia demos on display. But if you want to plunk down your credit card to invest in the multimedia revolution, better have a long talk with your CEO first.

Paul Gillin, Editor

Fighting only half the client/server battle

The fine article "TI tools will keep legacy systems going" (CW, Oct. 18) describes how to migrate code from legacy mainframe applications to client/server environments.

That's great, but it's only half the battle.

These tools don't address the migration of the actual legacy data—described by formal inconsistency, mixed encoding and such an ad-hoc comment fields that fail to map to relational tables, anomalies in names, addresses and other entities that must be identified and consolidated, and smudgy other data contaminants.

Gartner Group, Inc., warns that mere re-engineering efforts will fail because of a lack of attention to data quality. When raw legacy data is migrated to a new environment it exposes your new system to data contamination that will destroy the value and integrity of your information.

A successful strategy places data re-engineering—the automated conditioning, standardization and consolidation of legacy data—directly on the critical path of business processes re-engineering.

The answer is people, not tools

Your article "Think big picture for client/server" (CW, Oct. 25) correctly identifies the overwhelming variety of technologies, vendors and users involved in the major obstacle to successful implementation of client/server systems. The solution proposed, however, seems like more of the same: more tools and even more technical forms.

Sidewinder lies not in the tools but in the people. In a word, the answer is teamwork.

Systems development life cycle methodologies such as Method/1 and Information Engineering were successful only to the degree to which they were able to subdivide complex, interdisciplinary projects into portions that could be completed by autonomous groups with homogeneous skills.

However, it seldom worked well and will not work at all. The relentless advance of new technologies such as client/server is rendering this artificial task structure. The requirement today is to help groups that must work together.

Do it for the productivity, do it for the satisfaction, do it for the health of your staff. Do it.

No grousing here

I enjoyed your article about Banyan third-party developers. "Third parties grouse over Banyan's GUI plan" (CW, Oct. 4), you implied that LANshark Systems, Inc. was one of the "disgusted" third-party devel-

opers upset with Banyan for competing with those developers.

We are not upset with Banyan about this particular issue.

In fact, Banyan solicited our input for this project more than three months before and was very up front with us about its development plans. All of the third parties that were invited to bid on the graphical user interface development project were similarly informed.

We appreciated Banyan's solicitation and were very happy that it followed through with its development plans with us for enough in advance to prevent any surprises.

Other third-party developers, knowing that Banyan was pursuing this development path, chose to continue development on their products and may indeed now be upset with Banyan. We are not among them.

Think twice before you say 'open'

Joanne Kelleher

A word in all wise computer systems sales personnel: If you use the word "open" these days, you'd better be talking about the office door or trade policy or seating on the shuttle flight you're about to catch. Openness is a fine adjective in any of those contexts, but it's poison as a selling point. A couple of stories from a conference I recently attended:

A few hours before his speech, one of the presenters asked about whether the phrase "client/server" in his session title might actually turn out to be a turnoff for the audience. "Nah, that's not OK," he said, deciding that there was probably a few good miles left in that concept. "The really important thing is that I am bringing up 'open' systems."

Fast forward a few hours. Sessions are over, and a top 15 executive from a major consumer products company jokes about how he's simply fed up with that damned description, especially as it emerges from the mouths of system vendors. "You know what I do?" he confesses gleefully. "I give each of my vendors a stack of six colored chips — like the ones in casinos — and I tell them, 'Every time you say it, you have to give back one chip. Run out of chips and you're gone.'"

Next day, another CIO proudly describes a

new LAN-based system being rolled out at his organization. It's a great system. He's very proud of it and sure it will bring major productivity benefits. His only regret? His organization could have planned better and gotten the application on stream faster if he'd known just how much connective code had to be written to get all the pieces to work together.

That's not all. It's hard to estimate how long a development project is going to take and how much it is going to cost without having to contend with inflated claims and unrealistic promises. And the worst part isn't even having to write all that connective code; it's knowing you've been led down the proverbial primrose path. It's also having to listen to the same supplier insist that nothing like this has ever happened with its system before.

Sure. Just like your mechanic can't hear the nonstop engine clanging that just happened to start as you pulled out of his service bay.

The thing is, there's been so much hype and abuse that people pay about as much attention when a vendor trumpets the openness of its product as the average New York pedestrian pays to a car alarm. OK, maybe a little more. Because, after all, there is one way that a claim of open systems can definitely benefit a purchaser. Here's how:

It can be met.

"All I do," he said with a wide grin, "is tell my vendors, 'Since your systems are open and work with everything, I decided I should check out the prices of some other systems. I had no idea how cheap things were these days.'" He swears it works even better

than the failed Amazak mug waved in front of an IBM sales rep.

So maybe, on second thought, you vendor types ought to keep it up. Times are tough, and it's kind of nice to see IS executives enjoying a good laugh.

Kelleher is Computerworld's features editor.

Rapid development melts nasty buildup

Patricia B. Seybold

Bureaucracy can't stand up to rapid application development. The two are mutually exclusive. If you don't believe that, talk to Bill Kilmartin. Kilmartin is the comptroller of the Commonwealth of Massachusetts, where the budget is more than \$20 billion per year, more than 75,000 employees are on the payroll and bureaucracy has been elevated to a fine art.

Kilmartin has problems — very large problems. He has millions of dollars worth of legacy systems that don't give his end users or his stakeholders the information they need and can't even pay his bills in a timely fashion.

The current systems are very good at extracting for goods and services. Procurement procedures are so refined that it takes 90 days just to gain agreement to do business with a vendor and 28 laborious steps to award a contract. Then it takes at least three months to process one once it's been awarded.

To compound the situation, user departments are each mired in their own bureaucrat-

ies. None of them can fathom moving quickly, and each runs its own duplicative systems because none would trust the information or the procedures put in place by another. It's hard to know where to begin trying to make a dent in 20 years' worth of fossilized practices. But Kilmartin took 55 of his top people and their key users off-site for a four-day exposure to state-of-the-art business process

redesign and rapid application development.

He broke his troops into high-performance teams and seeded each team with people from the private sector who had been instrumental in leading their organizations through large-scale change.

For the first two days, the teams acted the same way they do in state government. They deliberated. They debated. They blamed the other guy for the current state of affairs and scoffed at these high-tech tools. But gradually with a great deal of prodding and a set of impossible deadlines, they began to experiment. They rolled up their sleeves and actually designed streamlined processes.

By the end of the four days, the teams had

accomplished the unbelievable. They had built a fairly comprehensive process and object model of the state's financial systems. They had built and delivered a first-pass, working employee information system. They had designed a new business process for the daily disbursement systems and mapped out the game plan for piloting systems in four major departments within the next six months.

They had redesigned the entire procurement process, designed a pilot kiosk-based application for giving citizens access to government information and kicked off a pilot project to deliver welfare payments via electronic funds transfer. They had mapped out an architectural strategy for integrated computing. And they had wrestled with the organizational changes that must be made to lay off the redundant and pilot its take root.

Can this kind of catalytic experience produce lasting change? I believe it can. I know that in the usual course of things, lessons learned and words made while away from the office are often swallowed up by the bureaucratic rut of routine. But show people what's possible with rapid, iterative development and they'll never be happy with two- to five-year development cycles and the status quo again.

Seybold is president of the Patricia Seybold Office Computing Group in Boston. Her Notes address is Patricia.Seybold@PSOCG. Her Internet address is Pseybold@MCI.com.

Arms of consultants or contract programmers can't dissolve years of fossilized practices. The only thing that will expose to fast, iterative development.

OS/2 makes headway in corporate arena

Deals show Version 2.1 giving Windows NT a run for its money

By Ed Scannell

With an uncharacteristically gritty determination, IBM's Personal Software Products group recently knocked some holes in the wall of user skepticism that has kept OS/2 off most corporate desktops.

When Personal Software Products delivered OS/2 2.1 this past June, the company delivered a product that crystallized a six-year ambition: a 32-bit desktop operating system that reliably runs DOS, Windows and OS/2 applications side by side with the thousands of mission-critical applications developed by corporate accounts.

In the last couple of months, Personal Software Products has signed a handful of impressive licensing deals for OS/2 2.1 in the U.S. and overseas totaling more than 200,000 copies. Sales of the OS/2 2.x series are between 2.5 million and 2.8 million copies, according to most industry researchers, and should surpass 3 million by year's end.

While reliability and more robust features have helped in Version 2.0's success, the fact that some large accounts say it compares favorably to Microsoft Corp.'s Windows NT has also contributed.

"The truth is that OS/2 is the only 32-bit desktop operating system that runs reasonably well on the hardware that is out there," said Neal Hill, a former senior software analyst at Forrester Research, Inc., in Cambridge, Mass. "These corporate labs are holding up because [OS/2 2.1] can do things like maintain three or four communications sessions reliably out of a client back end."

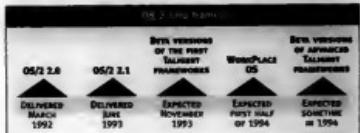

Perenzi debuts

With the Comdex/Fall '93 introduction of the Windows-less version of OS/2, code-named Perenzi, IBM hopes to top up Version 2.1's momentum.

Because it works seamlessly on top of DOS and Windows and is expected initially to cost \$50, Perenzi should give IBM some teeth in its battle against Microsoft in the very lucrative Windows market.

"There are a hell of a lot of PCs out there without OS/2, and the only shot IBM has to get users to make [the conversion] is to make it painless and inexpensive. I think Perenzi deals with that issue," said one Windows developer.

If Perenzi can yank large numbers of Windows users into the OS/2 camp, more large software suppliers might be interested in writing OS/2-specific applications, something the system has always needed badly. And it

large independent software vendors write more applications, there will be more pressure on large systems makers to exclusively handle the operating system, something OS/2 needs even more.

"You have to provide an OS/2 kick in virtually no cost to OEMs; otherwise, they have to replace the stuff they are shipping [DOS and Windows] and pay double licensing fees," said Randall Fox, president of Scientific Systems Corp., a maker of OS/2 productivity applications in Seal Beach, Calif. "This way, OEMs can just

OS/2, page 42

Object-oriented software

Borland technology chosen for electronic trade network system

By Michael Vizard

It looks like some of Borland International, Inc.'s investment in object-oriented application development is finally beginning to pay off.

Thomson Financial Services, a Boston-based unit of Thomson Holdings Ltd., is less than two months away from going live with Anvil, its electronic trading system for variable-rate municipal securities that is based largely on Borland technology.

Currently in beta testing at more than 20 securities firms, the financial industry's first municipal trading system calls for the installation of Borland's Quattro Pro for Windows spreadsheets and Paradox relational databases at every trader's desktop, Thomson executives said.

Those applications, which will process about \$10 billion worth of trades a day, will be linked to an inter-bureau relational database running on a fault-tolerant local area server from Stratus Computer, Inc., which in turn will be linked to another Stratus system in the compa-

Source: Thomson Financial Services, Inc.

Good news

Since lowering the price of Quattro Pro for Windows to \$50, Borland has sold more than 500,000 copies.

... and financial concerns

While Borland's recent spate of financial industry wins may give other users pause, Fred Cohen, Thomson's director of technology, said that Borland's technology is strong enough to guarantee it would be acquired by another vendor if the firm were not able to recover itself.

IBM's Boston office. That server will then forward transactions to a Sybase database from Sybase, Inc., which runs on a cluster of servers from Sun Microsystems, Inc.

"I think the biggest problem in Borland has with Paradox is that it's priced so inexpensively that no body takes it seriously. All the databases on the network will be synchronized, and the Stratus systems will guarantee delivery of the trades to the Sybase database," said Fred Cohen, Thomson's director of technology. Paradox's base price is \$148.95, while the Workgroup Edition, which includes SQL links and Borland's Object Exchange (Obex) technology, is priced at \$440.

Shared technology
Due to the synchronization requirement, Cohen said he opted to deploy Borland products on client desktops and local servers because they share the same underlying database engine technology that Borland acquired from Interbase. As such, it is easier to share data across Quattro Pro spreadsheets and Borland databases.

Cohen said Borland has done a substantially better job in terms of integrating SQL calls seamlessly into its Quattro Pro spreadsheet by encapsulating them in objects. In contrast, other products, such as Excel from Microsoft Corp., essentially require users to edit their

spreadsheet application to query databases, according to Cohen.

At the same time, Cohen credited Borland with providing a more robust application development environment in the form of Object-Pal than the Visual Basic environment that Microsoft provides with its Access database.

"It's taken Borland a while to bring products to market, but it's really starting to pay off now. We originally were building the sheets in C and were into hundreds of thousands of dollars of overtime and weeks behind schedule. The problem was that the original approach was archaic from the start and was too labor-intensive. Now we've cut that development time by 90%," Cohen said.

Since Thomson had already established network links to brokerage houses as part of its other financial services, Cohen said the project has cost the company about \$1 million to implement, which will be recovered by charging customers for access to data in the Boston office.

Thomson plans to expand the service to 100 securities firms and will adopt Borland's Obex technology to link its applications with other desktop applications.

"We'll provide some high-powered analytical tools, but the traders will have other applications on their desktops that they want to tie in," Cohen said.

MICROSOFT AND LOTUS E-MAIL PRODUCTS TO

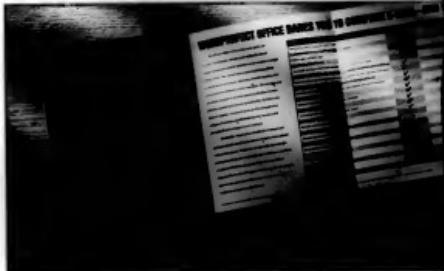

HERE'S WHY.

WordPerfect Office

Microsoft and Lotus aren't going to publicly compare their e-mail products to something substantially better. That's why they never

mention WordPerfect® Office in any of their e-mail comparison advertising. But while Microsoft and Lotus won't compare their products to WordPerfect Office, you should. Because choosing a workgroup application is a strategic decision that will affect the way your organization works for years to come.

Dare to compare more than just e-mail

Even if you just compare e-mail features, WordPerfect Office 4.0 beats everything in its class. But it takes a lot more than

NEVER COMPARE THEIR WORDPERFECT OFFICE.

	E-MAIL	INTEGRATED GROUP SCHEDULER	INTEGRATED CALENDAR	INTEGRATED TASK MANAGEMENT
MICROSOFT MAIL	YES			
LOTUS CC:MAIL	YES			

WordPerfect is a registered trademark, and WordPerfect Office is a trademark of WordPerfect Corporation within the United States and other countries. All other brand and product names are trademarks or registered trademarks of their respective companies. © WordPerfect Corporation 1990.

e-mail to run a business these days. WordPerfect Office is the *only* leading workgroup application that integrates group scheduling, a personal calendar and task-management functions

with the industry's most powerful cross-platform e-mail engine. And WordPerfect Office gives you the complete package for what others generally charge for e-mail alone. Call (800) 526-5064 for a FREE "Dare to Compare" kit. There are more than 100 different features you should compare when choosing a workgroup productivity product, and we can't begin to mention them all here. So we've prepared a free Dare to Compare demonstration kit, with a working copy of WordPerfect Office 4.0 and a detailed comparison guide. Find out for yourself why Microsoft and Lotus won't compare their e-mail products to WordPerfect Office. Call (800) 526-5064 for your free kit.

Desktop Computing

Carole Patton

Organizing your time

You can set beads nodding in any American corporation by talking up good management practices like setting goals and giving employees feedback. Trouble is, many managers are stretched so thin they can barely remember where they are or where they are supposed to be, let alone track all the people and projects under their supervision.

Software tools can help. I'm not talking about traditional project management packages like Project, Timeline or Super

Project. Those are all fine for what they do, but sometimes what's called for is something of a more personal nature.

One product tailored for busy managers on the go that is definitely worth a second look is ManagerPro 2.0 from Avantos Performance Systems in Berkeley, Calif. A real life-saver indeed, this program is one of my favorite finds.

Written by former management consultant Norm Wu and Gerald Hines, ManagerPro defines a whole new software cat-

egory: It can actually help you manage people better, delegate more effectively, set clearer goals and provide needed feedback.

In its earliest iteration, Version 1.0, ManagerPro was little more than a high-level planner. But the latest version, which shipped last month, includes a daily calendar and to-do list, making it a really nice "home base" for managers.

The program's well-designed interface centers around a View Bar (like a tool bar) divided into Goals, People and Actions. Double-clicking on a name calls up pertinent job information (rate of pay, date of hire, etc.) and a personal data section lets you record other handy facts like a mobile phone or beeper number. All entries are in chronological order and all notes are time-stamped. A Goal Planner surveys goals in Gantt-chart form and includes a Status Board, where colored triangles flag specific problems.

The best part of this program is its "people" orientation. ManagerPro contains an on-line Advisor—it's like having your own management consultant. ManagerPro Version 2.0 supports groups of people working together through levels of access based on permissions set up by the administrator. For example, employees can see their "Programs," but not the supervisor's notes from a counseling session. You can extract your database, work with it on the road and come back and integrate your work on a record-by-record level.

ManagerPro 2.0 lists for \$395, but the street price should be closer to \$249. All entries are in chronological order and all notes are time-stamped. A Goal Planner surveys goals in Gantt-chart form and includes a Status Board, where colored triangles flag specific problems. The best part of this program is its "people" orientation. ManagerPro contains an on-line Advisor—it's like having your own management consultant. ManagerPro 2.0 lists for \$395, but the street price should be closer to \$249.

Personal management
If you're interested in a full-featured personal information manager (PIM), Packrat from Polaris Software in San Diego may be your first choice. But for now, make sure you're buying Version 4.1.

In August, I alerted you to problems with the Packrat upgrade (Version 5.0) and reported that a fix was on the way. But even the latest fix (Version 5.01) is giving users major problems, especially those who use Stacker. Polaris' testing confirms that temporary Packrat files have to be written to RAMdrive or to an unstacked drive or they'll be lost.

But if you bill time on an hourly basis and a full-featured PIM like Packrat is overkill, look at Time Logger from Responsive Software in Berkeley, Calif. With it, you click a button when you start work and when you finish and type some information about what you did in that time. Time Logger keeps track.

This program provides reports but not invoices. (You can copy data in tab-delimited format into Microsoft Excel, Word or even your favorite DOS-based accounting package.) Time Logger can be used for billing purposes, to track an office full of people or to keep tabs on corporate resources like computers or conference rooms. The product shipped last month and is sold directly from Responsive Software for an introductory price of \$89.

INTEL '92

HOW WE'RE GIVING PCs ELECTRIFYING POWER.

pentium

There is a new source of computing power. It's capable of executing two instructions at once. It's produced processing speeds over 100 MIPS. It's the next generation of compatible power. It's called the Pentium® processor. And this brief will tell you how its technology is making PCs run faster today.

THREE WAYS TO MAKE FASTER PCs.

Faster PCs start with faster microprocessors. And there are three ways to make faster processors:

1. Increase the number of transistors.

Today, the use of sub-micron components lets designers fit more than 3 million transistors on a single chip. So we can integrate components such as math coprocessors and caches right onto the CPU—dramatically cutting access time.

2. Increase the clock speed. Twenty years ago the clock speed ticked

along at a measly 4.7 MHz. Today we can run at an astonishing 66 MHz—and we're still pushing for more.

3. Increase the number of executions per clock cycle.

Using new superscalar technology, our processors are now capable of executing two instructions per clock cycle.

MIPS

WORKS IN PRINCIPLE AND IN PRACTICE.

Employing the techniques above, we've created the new Pentium processor. A processor that is over 300 times faster than the first PC microprocessor.

THE PENTIUM PROCESSOR. A MODEL OF EFFICIENCY.

The Pentium processor can be described as a super-efficient factory. Its main assembly line is its superscalar technology—which enables information to be processed simultaneously through dual pipelines. To accomplish this, the pipelines divide up an instruction, then send it through five stages. As it passes from one stage to the next, the pipeline is free to begin another instruction. Speeding up operations substantially.

PUMPING DATA THROUGH.

The rest of the features on the processor are designed to keep that main assembly line working at peak capacity (see diagram). These features, along with the superscalar technology, help the Pentium processor to crunch more than 100 MIPS at a clock speed of 60 MHz.

HOW FAST DID YOU SAY?

Twice the performance of our own Intel486™ DX2 66 MHz processor. Plus, the redesigned floating-point unit on the Pentium processor offers up to five times the performance of the Intel486 DX2-66 CPU for math-intensive applications.

THE NEW PENTIUM PROCESSOR IS FULLY SOFTWARE-COMPATIBLE WITH OUR INTEL ARCHITECTURE FAMILY.

A PHOTOGRAPHIC
MEMORY RIGHT ON
BOARD.

BASIC COMPUTER.

BASED ON SPEC 92, THE INDUSTRY STANDARD WORKSTATION BENCHMARK, THE PENTIUM PROCESSOR IS IN THE SAME PERFORMANCE CLASS AS THE BEST WORKSTATION. BUT THE PENTIUM PROCESSOR IS RUNNING AT ONLY HALF THE CLOCK FREQUENCY, AND SYSTEMS BASED ON THE PENTIUM PROCESSOR COST ONLY ONE-HALF AS MUCH.

**WHAT DOES THIS
TECHNOLOGY REALLY MEAN?**

It means Pentium processor-based PCs are now as fast as workstations. It means faster Intel486 microprocessors, because our experience with Pentium processor technology allows us to improve them. It means new software horizons being brought to more and more users—such as

OBTAINING THE POWER

Almost all leading PC vendors have introduced high-performance Pentium processor systems at affordable prices.

As we increase the production of Pentium processors from hundreds of thousands in 1993 to millions in 1994, there will soon be scores of Pentium processor systems to choose from. These systems will be available in a wide variety of configurations, from high-performance desktops more powerful than existing engineering workstations to servers containing

multiple Pentium processors and capable of replacing mainframes.

TECHNOLOGY YOU
TRUST.

For over 20 years, Intel has led microprocessor design, development and manufacturing. So with Intel technology inside, you can be assured of unprecedented power and unquestioned compatibility.

BESIDES RUNNING EVERYDAY APPLICATIONS BETTER, THE PENTIUM PROCESSOR PROVIDES THE POWER NECESSARY FOR NEW MULTIMEDIA APPLICATIONS LIKE DESKTOP

Telecommuter quandary: Who buys the PC?

By Mitch Betts

ARLINGTON, VA

Lucking behind glowing telecommuting reports is an issue for corporate managers that gets down to the nitty-gritty: Should the company buy two PCs for telecommuters—one for office use and one for days worked at home?

That was one of the great debates featured at the recent Telecommute '93 conference here. Edward Kirby, manager of telecommuting at Bell Atlantic Corp. in Silver Spring, Md., argued that telecommuters, who typically work two or three days at home and the other days at the office, should buy their own PCs. He cited the following reasons:

- Duplicate PCs make it harder to cost justify telecommuting.
- Cost exposure is limited if telecommuting does not work out.
- It is harder to track or police off-premises equipment.
- Duplicate PCs

for telecommuters appear wasteful to other employees.

From a telecommuter's perspective, it is easier to upgrade and tailor his system without the corporate bureaucracy.

Each year, telecommuting expenditures total \$4.7 billion for PCs, fax machines, phones and network services. These costs are shared equally by telecommuters and employers, according to Link Resources Corp., a market research firm in New York.

"Just as workers buy their own cars to commute to work, now they are buying their own computers to telecommute," said analyst Thomas E. Miller, who conducted the Link study.

Drew Deskar, director of telecommunicating and manager of telecommunications

at Shiva Corp. in Burlington, Mass., took the other side of the debate. He argued that if companies do not pay for the home-based PCs, telecommuting will never be broadly adopted and companies will lose their productivity and employee-retention benefits.

In other words, Deskar said, employer stinginess will turn telecommuting into

an executive "perk" for upper-class employees who can afford their own PCs.

David Jackson, director of information systems at Monsonic Co. in St. Louis, said he decided to supply PCs and software to his firm's telecommuters partly because it would ensure a standard set of hardware and software to support.

Jackson, a speaker at the conference,

said Monsonic strikes a fair deal with its telecommuters: The company provides the PCs and telecommunications, while the telecommuter provides an ergonomically acceptable office at home. "No PC on the dining room table," he said.

Some companies may be concerned that the home PC will be used only 20% of the time, doubling the technology investment. But in Jackson's opinion, "Since we're getting more productivity [from the telecommutes], I don't really care."

Enterprise Application Development

Executive Strategy Conference

If you are responsible for charting your company's global efforts to deploy mission-critical business and technical applications, then you'll need to attend *Enterprise Application Development: Executive Strategy Conference*. This special event will be held for one day only on the West and East Coasts this coming December.

What will be there

- Morning and Afternoon Keynotes including Helene T. Ross, Timna Schad and Daniel A. Karp
- Over 30 leading experts, including Peter Coal, Judith Harwitz, Dan Kara, David Lanthier, Tom McCabe, Peter Maron, Howard Rubin, Bill Ulrich, Elliot Weinman, Nick Wybott, and Aaron Zornes
- User examples of industry-leading applications!
- Expo featuring Enterprise Application Development Solutions in Action!
- Comprehensive four track program
- Managing Open Enterprise Applications Development
- Object-oriented Development
- Building Client/Server Applications
- Software Re-engineering and Maintenance
- Management panel sessions
- Private user group meetings
- In-depth product education sessions
- All this for only \$195!

How to get there

- Call 1-800-457-6298 and reserve your spot today!
- Send your payment (check, credit card, or purchase orders accepted) by November 1st and qualify for the early-bird price of \$145—45¢.

Anxiously awaiting Taligent

PERSONAL SOFTWARE PRODUCTS' long-term goal is to have its component technology, currently known as the ObjectLink operating system that Taligent, Inc. is expected to deliver in 1995.

The finished Taligent operating system, as opposed to more ambitious than Microsoft's Windows NT or its successor, Cairo,

— which consists of IBM and Apple Computer's own — is intended to be portable and object-oriented — from the user interface down to the hardware.

"When IBM is trying to do its best," Microsoft said, "it's not the most innovative operating system around," said John Doria, a vice president of Worldwide Technologies, Inc., a company in Somers, N.Y.

Longtime IBM software engineer Dennis T. Stoenell, who has developed versions of Taligent in his spare time, has come up with a framework of the component system's technology to which it adds application frameworks.

The first beta version of the application framework he has created for delivery this month to a limited number of developers. The technology allows OS/2 2.1 developers, for instance, to start programming "Taligent-like capabilities into their applications."

A problem for some OS/2 developers in terms of generating interest is not knowing

specifically what features the frameworks will allow them to add into their applications.

Some of those capabilities include making OEM applications more portable across multiple environments or the ability to include three-dimensional graphics.

"You can easily deliver the client portion of your application across all operating systems in your enterprise, your Web to anyone because you are not stuck on the big brother dictating what sort of hardware someone has to use," said Bob Horner, manager of automation technology at Southern California One Corp.

The next set of application frameworks, the beta versions of which are expected sometime in 1994, will expand more of the Taligent programming model to OS/2 developers.

"The documented framework [main programming model] around Taligent is where applications get the ability to collaborate with other applications in real time," said Kathy Behar, Personal Software Products' lead architect for object frameworks. "They will also get all the infrastructure for the user or interface."

— Ed Stoenell

OS/2 makes headway

CONTINUED FROM PAGE 37

throw a CD [Perengi] in their boxes for \$60."

A version of OS/2 that could cut into sales of Windows 3.1 would be one that runs comfortably in 4M bytes of memory (the product currently needs at least 8M bytes to do so).

Company officials predicted earlier this year that such a version would be available by year's end. It appears, however, that Personal Software Products is bogged down in the project, and sources say it may not be until next year.

"There was some older code [from earlier versions of OS/2] that was never changed from 16- to 32-bit," said one developer familiar with the project. "I believe it is mostly code written by Microsoft."

The Microsoft challenge
But while IBM now has OS/2 rolling, it must still remain light on its feet to avoid the logs Microsoft will inevitably throw across its path.

Microsoft is already beating the

marketing drum for Windows 4.0, code-named Chicago. Whether or not the product turns out to be a reliable 32-bit operating system on the order of OS/2 2.1, the marketing efforts may prove to distract some potential OS/2 users.

And in an attempt to bolster the hundreds of bonding deals it has with OEMs for DOS and Windows, Microsoft this week is expected to announce that a large number of OEMs will bundle its Windows for Workgroups 3.11 on both server and desktop machines. Version 3.11 adds a 32-bit file system and peer-to-peer networking to Windows 3.1.

More importantly, Windows for Workgroups 3.11 continues to support Microsoft's 32-bit virtual device driver (VxD) model, which OS/2 and Perengi do not support.

Even though few Windows applications support VXDs, this feature remains another grenade Microsoft can lob toward IBM's claims that OS/2 is a better Windows than Windows.

This will rock the com

Audio. Scanner. Floppy. 165,000 Xstones.

The new line of HP ENVIZEX stations is shaking other X terminal makers with its sophisticated features, raw speed and low prices.

It offers unsurpassed multimedia readiness and PC interoperability with an internal floppy drive, scanner support and CD-quality audio. A selection of local clients are also available.

Typical cost: \$4,605* for the 165,000 Xstones, 19" color X station. No wonder we're the world's #1 X terminal vendor. For more details, call 1-800-637-7740, Ext. 7881. In Canada call 1-800-387-3867, Dept. 2306. Then get your company on a roll.

*CD-quality audio, local scanner support and optional floppy drive available as options. Speeds not included. ©1993 Hewlett-Packard Company, X Business Group, January 1993, by exec. reprod.

Desktop Computing

Two future products that could help Personal Software Products be an effective moving target against Microsoft are Taligent and WorkPlace OS, the microkernel version of OS/2.

WorkPlace OS, based on an adaptation of Carnegie Mellon University's Mach microkernel, is a scalable operating system designed to run, eventually, on every class of system from IBM's PowerPC-based servers down to handheld devices.

SPLIT PERSONALITY

It will support symmetric multiprocessing and have multiple "personalities," or the look and feel of several environments including OS/2, Windows, DOS and Unix. The product is expected to be available by mid-1994.

WorkPlace OS figures to be the first line of defense against Windows NT and is also targeted at multiple hardware platforms. Windows NT has gotten off to a fast start, shipping its first million unit in the first 90 days.

If large corporate accounts continue to order products at this pace, it is expected to place enormous pressure to succeed on WorkPlace OS.

Databases

Kodak organizes photo CDs with image manager software

By Michael Vizard

Eastman Kodak Co. in Rochester, N.Y., recently began delivering its Photo CD image manager software for Windows, which gives users a database that can reference more than 30,000 files containing 35mm slide film.

Called Kodak Shoebox, the \$345 database is intended to give users an on-line method for accessing slides stored in any type of format on a CD drive. Shoebox is intended for slides that previously had to be archived manually in file cabinets.

Once stored, these images can be incorporated into other applications and documents. For example, Living Rooms Associates, Inc. in Parsippany, N.J., is building a plant catalog on top of Kodak Shoebox.

This catalog will make use of the database's ability to attach 30,000 characters of text to each image stored, which means that images can be easily reused and tailored across multiple catalogs.

"We've got about 300 images in our initial catalog to which you can attach descriptions of the plants, height, color and care instructions," said Tom Creeden, who along with Joe Siaslone

founded Living Rooms Associates.

Based on a Bri雗e database architecture, Kodak Shoebox includes an indexing tool that allows a user to search for specific types of images across the database. For example, a user can specify that he would like to see all photos with children.

Multiple uses

Given its capabilities, Creeden said he expects to see Kodak Shoebox adopted across a wide range of industries.

"You can use this catalog on everything from wine to medical supplies. As a teaching reference tool it's unbelievable," Creeden said.

In addition, Kodak Shoebox can be linked with other applications such as presentation graphics and word processing packages, through the Clipboard facility in Windows. In the coming year, Kodak also plans to add support for Version 2.0 of the Object Linking and Embedding interface, which will allow users to call images from Kodak Shoebox without having to exit their programs.

As part of a special introductory offer, Kodak Shoebox can be purchased for \$99 through the end of the year.

Briefs

Products bundle up
WordPerfect Corp. and IBM's Personal Software Products group have agreed to a product bundle for European markets that combines WordPerfect 5.2 for OS/2 with OS/2 2.1. The three-month agreement begins this month. The deal is the first phase of an agreement that includes cooperation among sales forces of each company's European offices. Pricing on the two-product bundle will vary in each country, but it will be similar to the unbundle WordPerfect for OS/2.

Verity chooses OS/2
Verity, Inc. recently announced it has begun shipping its document retrieval software for OS/2 2.1. Earlier, Verity shipped its software on Sun Microsystems, Inc.'s Solaris 2.2 operating system.

petition.

Desktop Computing

Software

Software Illustrated has announced MapLand for Microsoft Corp.'s Excel for Windows, spreadsheet mapping software.

According to the Pleasanton, Calif., company, users are able to chart data in

a map inside a spreadsheet.

Users can also create pie maps, shaded maps, column maps and pin maps of their data. Spreadsheet Mapping allows users to link data to maps.

Fourteen geographic workbooks with major cities and country boundaries are provided.

MapLand for Excel for Windows costs \$99.95.

► *Software Illustrated*
(510) 463-9898

Age Logic, Inc. has introduced XoftWare/32 Version 3.0, part of the XoftWare/32 line of 32-bit PC X Window System server software. Version 3.0 is available for Windows and OS/2.

According to the San Diego company, XoftWare/32 for Windows is optimized for the Windows operating platform and allows users to concurrently access and display Windows, DOS and network-based Unix applications on the same PC. Version 3.0 of XoftWare/32 for OS/2 en-

sables PC users to simultaneously access and display network-based Unix applications with Windows, OS/2 and DOS applications.

Highlights include Network File Manager (NFM) local printing capabilities, NFM graphical file browser, a concurrent Windows Manager Mode and 32-socket support.

The Windows and OS/2 versions of XoftWare cost \$395.

► *Age Logic*
(619) 455-8999

WordPerfect Corp. has introduced 20 Language Modules for WordPerfect 6.0 for DOS.

According to the Orem, Utah, company, Language Modules allow users to use international versions of a hyphenation module, spell checker, thesaurus and/or keyboard with WordPerfect.

Features include a WordPerfect Coach feature, full WYSIWYG editing, built-in spreadsheet functionality, scalable font support, dialog boxes, button bars, drag-and-drop text and graphics and fax, sound and electronic-mail capabilities.

The DOS Language Modules cost \$60.

► *WordPerfect*
(801) 225-5000

Counshare, Inc. has announced the Arthur Allocation System, a platform-independent client/server retail application.

According to the Wilmington, Del., firm, the Arthur Allocation System delivers high-value decision-support capabilities to allocation teams in medium to large-size retail organizations.

The product works with the company's Arthur Performance Tracking, Arthur Merchandising Planning and retail processing systems.

The Arthur Allocation System is platform-independent and can perform in multiple retail environments.

System requirements include a 33-MHz 486-based PC or above, 4M bytes of RAM, a Video Graphics Array monitor and a mouse.

Pricing is expected to begin at \$50,000 for a 10-user license.

► *Counshare*
(302) 479-5454

Hardware

Opus Systems, Inc. has announced Inognito Unix application engine, a software and hardware package that lets Windows, DOS and OS/2 users run the same applications that run on Sun Microsystems, Inc.'s SPARCstations.

According to the Santa Clara, Calif., company, the application engine lets PC users continue to work in a familiar PC environment, share information between their Unix and PC applications and receive transparent access to a variety of 32-bit Unix applications.

Users need to install a PC/AT add-in board, a hard disk drive and PC software.

The basic configuration for the Inognito application engine, including the Inognito/Engine/M51, Inognito/QuickStart and Inognito/Share, costs \$890.

► *Opus Systems*
(408) 562-0340

NOW, DO YOU HAVE ENOUGH ROOM TO USE IT?

If you're running OS/2, you've probably discovered how much disk space your powerful new operating system demands.

Not to worry.

With Stacker® for OS/2 & DOS, you can quickly and safely double the capacity of your hard disk to take full advantage of OS/2's power.

Using Stac™ Electronics' patented, award-winning Stacker L2™ technology, Stacker instantly and transparently compresses all your data, storing it more efficiently so you have more room to work.

That's all there is to it! You can install Stacker in minutes and access all your compressed files at any time, whether you boot from OS/2 or DOS.

And, with the Stacker Optimizer™ you can quickly defragment your Stacker drives to get the best possible performance. Stacker stores data on disks as large as 1 gigabyte, giving you up to 2 gigabytes of disk capacity. And, it even comes with a simple Unstack command that returns your system to its original, uncompressed state.

New Stacker for OS/2 & DOS. Think of it as adding space to your OS/2 workplace.

At Unisys, three open client/server platforms provide you with options.

Because offering just one doesn't give you an option.

To help you build your business, an open client/server platform is a basic tool. To help you choose the right tool for the job, Unisys offers three powerful, open client/server systems.

Our U Series UNIX systems are outstanding servers and workstations for commercial applications—and they offer comprehensive LAN and WAN internetworking capabilities.

PW[®] Advantage Series PCs are the perfect choice to support personal productivity and executive applications within a network. They are MS Windows-ready and can support network-transparent communications not only for MS Windows but also for NetWare, OS/2, SCO and Windows NT.

CTOS is an internationally proven system tailored for customer service. With a dramatically low cost of

administration, it's ideal for replicated client/server applications. And all

Unisys client/server systems are powered by Intel microprocessors.

Call Unisys at 1-800-874-8647, ext. 189. Ask how a choice of our open client/server solutions can help you hit the nail on the head.

UNISYS

We make it happen.

Before You Commit To High Availability Computing, Maybe You Should Take A Closer Look.

First, the bad news. No matter what you've read, heard or hoped, high availability solutions are not what they appear to be. If you're dealing with critical, large transaction volume applications, high availability systems simply can't protect you from downtime. They might recover eventually. But recovering is not the same as not failing. And the real cost of computer downtime to American business is staggering. In terms of lost revenue. In terms of lost productivity. In terms of lost data. In terms of lost customers.

And the news gets worse. Even if high availability were a proven solution for mission-critical applications in other respects, which it's not, it runs on garden variety UNIX®. Based on that alone, its reliability has to be questionable.

If you're looking for availability in an open system, be prepared for another disappointment. The special programming a high availability solution requires almost always turns it into a proprietary system. No one can tell you what it's really going to cost to implement or how many vendors it will take.

And when the system fails, who do you call? The hardware vendor? The software vendor? Your consultants? It all gets very, very complicated, very, very fast.

None, for the good news. Stratus® is exactly what it appears to be. A complete, proven solution that delivers continuous availability for critical, large transaction volume applications. Not high availability. Continuous availability. And

when you're dealing with mission-critical applications, you can't afford anything less.

Stratus is also simple and easy to install and maintain. Unlike high availability systems, Stratus requires no special programming or system administration. You won't have to hire consulting or software firms to configure Stratus for availability. You won't have to pay for two or more software licenses.

Since Stratus delivers true continuous availability with FTIX® (Fault-Tolerant UNIX operating system), UNIX SVR4 enhanced for availability, you'll also have something else no high availability solution can give you. A truly open system that delivers continuous availability that's completely transparent to both users and programmers.

Our online service is completely transparent, too. It's predictive. It's proactive. It's designed to keep you up and running. And it will. Continuous availability computing is all we do. And we simply don't believe in second best.

The news you can't afford to miss.

Give the gift of laughter.

What's so funny about technology?

Plenty — especially if you follow the cartoons of Rich Tennant in *Computerworld*.

The fact is, Tennant's whimsical "5th Wave" series has brought smiles to the faces of hard-working *Computerworld* readers since it first appeared in 1990.

Now we've taken some of his all-time funniest cartoons and turned them into a line of custom products that are guaranteed to delight and amuse.

Having trouble finding the right gift for a business associate who's just been promoted? Looking for an affordable birthday present for a co-worker? Need creative holiday gifts for client's in the IS industry?

Computerworld products are just the ticket.

You don't need a special occasion to give a *Computerworld* gift. But you do need to order right away, since supplies are limited.

Just fill out the attached form or call us at 1-800-222-7545 or fax your order to (508) 626-8258. And give the gift of laughter.

Workgroup Computing

Elisabeth Horwitt

Why go with peer-to-peer?

You know that old story about the guy who boasted he could make delicious stone soup? His friends said, "Right!" So he said, "Watch!" He put those big stones in a pot of water and then added a few carrots, a chuck or two of beef, a potato and an onion, and behold: stone soup!

Microsoft and Novell have been making stone soup lately with the latest releases of their so-called peer-to-peer networking products.

The idea behind peer-to-peer networking was to provide a low-cost way for a few users to share files and printers without the trouble and expense of setting up a full client/server system, along with network management, security and central administration. In a peer-to-peer system, each PC is both a client and a server, with users calling up whatever files or peripherals are designated as shareable on other PCs.

Such systems apparently fill a need among small businesses. Artisoft has done quite well selling its LANtastic peer-to-peer network to such firms. But Artisoft decided it wanted to sell LANtastic to corporations, too. Novell apparently had the same idea with NetWare Lite, as did Microsoft with Windows for Workgroups.

Good to that idea

But corporate network administrators reacted with strong aversion to the idea of letting their users share resources without the security, centralized administration and network management provided in a server environment. And corporations still peer-to-peer users should also be able to get all corporate files residing on NetWare servers. So the current versions of Windows for Workgroups, LANtastic and NetWare Lite (renamed PersonalNet) have all of the above capabilities.

So if your users insist on all of the capabilities of a client/server system, why bother with peer-to-peer at all? If you're adding onions, beef and potatoes anyway, why put in the rocks?

Managers interviewed at some corporate sites recently said they were considering putting in a peer-to-peer system as a way for workgroups to share a few files on local disks.

But of course, the real strategic significance of the Microsoft and Novell peer products is that they are being bundled, basically free, with Microsoft's Windows 3.11 and Novell's DOS 7.0.

This seems to be the most useful way to deploy peer networking — as an inexpensive way to make strategic desktop products network-ready in one more area in which Microsoft and Novell one-upmanship can flourish.

Horwitt is a Computerworld senior editor, networking.

Qantas takes off with Notes

By Michael Vizard

Qantas Airways has become one of the first players in the highly competitive airline industry to adopt Notes from Lotus Development Corp. as a communications infrastructure for coordinating the activities of multiple departments.

As part of an overall redesign of its business processes, Qantas has deployed Notes as a tool that will allow 13 departments to more effectively collaborate on the creation of airline schedules.

Called the Schedule Planning Network, or Planet, the Qantas implementation of Notes is built around a client/server model that seeks to augment the airline's existing information systems resources.

Inefficient processes

Initially, the airline plans to use Notes in place of a central administrative database that was charged with manually coordinating inputs from the various departments affected by airline schedules.

However, that process frequently proved inefficient because it required central administrators to verbally communicate with each department.

"We found ourselves changing schedules too much or too late. We

needed to get information for the departments earlier and build in an ability to be flexible," said Michael Head, a member of the chief information officer at Qantas in Sydney, Australia.

Despite Notes' use as an interactive discussion database that runs on top of the airline's proprietary QMail system, the Notes environment has been enhanced with an application that

keyed into the Airline Trips, Loads and Schedules system running on an IBM DB2 database deployed on a mainframe.

Immediate goal

Head said his next goal is to acquire schedule development tools that will create applications that span both the DB2 and the Notes environment.

Thus far, Head estimated that Qantas has spent about \$300,000 to build a Planet system that currently supports about 50 users. This does not include costs associated with a review of the company's overall business processes, which took place last spring.

"We had to examine the whole process because most of the areas of the company are touched by the scheduling system. It drives the cost and revenue of the business," Head said.

In the long term, Head said he expects to see other departments at Qantas adopt Notes. However, undertaking such an effort without reviewing the business processes in those departments would probably prove futile, he added.

"Notes is a great tool provided you re-engineer first. It's the glue for knitting everything together to create a whole new way of working," Head said.

Qantas is using Notes to coordinate the activities of its different departments as part of a re-engineering effort

Head calls the Balanced Scorecard. Using this application alongside Notes, users can evaluate proposed schedule changes against a set of business rules established by the airline's experts.

"The nice thing about Notes is now we have an audit trail of discussions that allows us to see where we might need to make changes," Head said.

Once the optimum schedule is evaluated, the actual schedule is manually

Chase seeks technology advantage

By Thomas Hoffman

The Chase Manhattan Bank NA in New York is in the early stages of developing an \$85 million distributed trading floor for 450 traders, and it is counting on Unix workstations and videoconferencing to improve access to market data and speed decision-making.

While the Sun Microsystems Computer Corp.-based Unix trading environment is hardly the first of its kind, industry pundits said Chase's plan to implement desktop-to-desktop videoconferencing over an Asynchronous Transfer Mode (ATM) backbone network is certainly leading-edge.

"This is the first commercial example [of trading-room ATM deployment] that I've heard of," said James Moore, president of Mentis Inc., a Somerville, Mass., technology market research firm.

Chase Manhattan NA has been reviewing ATM for its trading rooms for the past year and is considering the fast-packet technology for its trading floors, including its recently developed fiber-equipped trading room in Tokyo, according to Debra Williams, a former Citibank technolo-

Chase Manhattan Bank will be among the first to employ ATM technology in trading-room environments.

gist who recently became an analyst at The Tower Group, a Wellesley, Mass., research and consulting firm that focuses on banking applications.

Both Moore and Williams said ATM's high-

The Network Is The Computer.™

Corel wastes no time in offering Ventura upgrade

By Michael Vizard

Less than a month after acquiring the Ventura desktop publishing package from Xerox Corp., Corel Corp. late last month announced Version 4.2.

With Version 4.2, Corel has combined the Ventura Publisher and Ventura Data-base Publisher packages into a single en-

tity called Corel Ventura. It also added font, photo and clip-art libraries.

Priced at \$249, the package also now includes faster font-loading capabilities and support for Acrobat fonts from Adobe Systems, Inc. in Mountain View, Calif.

However, while Ventura users generally welcomed Corel's acquisition of the product, which had faltered under Xe-

rox, users will not see any substantial improvements to the core Ventura technology line until Corel unveils Release 5.0 sometime next year.

"Ventura users are starving for an upgrade. They haven't seen any substantial improvements made since Version 2.0. People are just going to have to patient through another release of the software."

But I think most users are willing to cut Corel some slack at least until they see Version 5.0," said Rick Altman, a Ventura user and an independent editor and publisher in Cupertino, Calif.

"The Corel acquisition couldn't help but do good. Ventura had been sort of floating around in never-never land under Xerox," added Frank Gibson, president of Publishing Technology Management, Inc., a consulting firm in Arlington, Mass.

Competition from within

At the same time, the Ventura publishing package has been facing stiff competition from Corel's QuarkXPress desktop publishing package and the rival Page-Maker offering from Aldus Corp.

In addition, companies such as Frame Technology Corp. have been merging word processing technology with desktop publishing packages, and word processors have added more sophisticated features.

Ironically, Altman noted that with Corel's acquisition of Ventura, the two may have come full circle. "Not many people remember that Corel got its start as a provider of add-on products for Ventura," Altman said.

But whether Corel will be able to breathe new life into the Ventura product set remains to be seen.

And the company has yet to divulge any product strategy for integrating Ventura with QuarkXPress.

"No matter whatever reputation it has lost, Ventura is still one of the most powerful programs ever delivered for desktop publishing. It may not be as flexible as some, but its strength is in the structure it provides," Altman said.

Corel's drive into the desktop publishing market is being driven by changing market dynamics.

"Since most graphics packages today have the ability to work with text, most people aren't distinguishing between graphics packages and desktop publishing packages anymore," said Michael Copland, president of Corel.

DO YOU KNOW WHERE YOUR ENTERPRISE IS GOING NEXT?

July 26-28, 1994 • McCormick Place • Chicago, Illinois USA

Enterprise Computing is the next level of IT business opportunity. It means taking performance and productivity to the limit—and turning your technology investments into a major competitive advantage.

Now there's a single source for enterprise technologies and strategies. A world-class exposition of systems and hardware, software applications, connectivity products and operating environments. A state-of-the-art conference to keep IT specialists on top of the technology—and senior executives on top of tomorrow.

ENTERPRISE COMPUTING EXPO '94. It's all the tools you need to take your enterprise into the 21st century.

SMC seeks Token Ring coup

Vendor brings prices closer to those of Ethernet

By Stephen P. Kleit Jr.

Standard Microsystems Corp. (SMC) last week kicked off a Token Ring strategy aimed at chipping away IBM's dominance in the market and bringing Token Ring prices more in line with Ethernet.

While Token Ring is faster than Ethernet—the technologies run at 16M and 10M bits/sec., respectively—the extra speed comes at a significantly higher price. For example, Ethernet adapter cards typically sell for between \$100 and \$200 while Token Ring cards start at roughly \$500. For users facing shrinking information systems budgets, this price disparity often makes Ethernet the most viable network topology.

To make Token Ring more competitive, SMC cut \$100 off the price of its 16M bits/sec. Token Ring adapters, which now retail for \$250, and slashed prices of the company's Multiservice Access Units (MAU) by 30%. For example, SMC's 12-port 4000 Elite Series MAU now sells for \$1,199 or roughly 57% per port.

"These price cuts are very aggressive," said Chitt Pettirocco, an analyst at International Data Corp. in Birmingham, Mass. "They have got to be one of the lowest price points."

SMC is also focusing on making Token Ring easier to use. For example, SMC ported EStart, an autoconfiguration and diagnostic program for its Ethernet adapter product line, to its Token Ring line. In addition, every card will include

SMC's Simple Network Management Protocol (SNMP) agent, PC Agent/SNMP, which provides network managers with inventory management, remote configuration checking and network troubleshooting capabilities.

"Our goal is to make Token Ring technology more accessible and affordable to the end user," said Lance Murrath, vice president of marketing at SMC's System Products Division in Hauppauge, N.Y. "We want to be the No. 2 player behind IBM and see no reason why we can't be with this program."

While SMC is well-known in the Ethernet world, it has only been in the Token

ring market right now, that would be a lot of jumping they'd have to do, and there are many hurdles to clear," said Stan Schatt, an analyst at market researcher Computer Intelligence/InfoCorp. in Santa Clara, Calif.

Its "biggest challenge is overcoming the compatibility issue—convincing people they are not going to get fired for buying SMC cards," Schatt said. "But these prices will get their foot in the door."

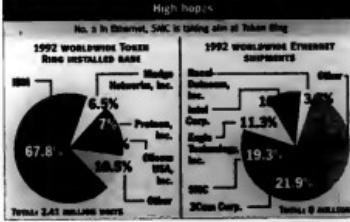

Initial impression

Laura Deets, LAN manager at Aon Specialty Group, a predominantly IBM customer shop in Tampa, said she was impressed with SMC's price points and was interested in evaluating the cards.

However, Deets said she probably would not go with SMC's MAU. "When it comes to the [network interface card], I'm open to other vendors," Deets said. "However, on the MAU level, while I'm sure there are other products that are compatible, IBM is probably a little more reliable."

To help overcome this mindset and ensure that its products are compatible with IBM networks, SMC has licensed IBM's LAN Support Program, which provides the NetBIOS and 802.2 Logical Link Control code for Token Ring networks, Murrath said.

In addition, Murrath said the company will provide free IBM connectivity consulting, and its products will carry a lifetime warranty and 30-day money-back guarantee.

Ring market for 18 months. Murrath said SMC's share of the market stands at roughly 4%, and the company's goal is to bump that up to 10% within a year, which would make it a distant second to IBM.

Analysts said they were pessimistic about SMC's chances of achieving that goal. "Seeing as they're not even among

net-optical drives typically store 200M bits of data per square inch. Future models will use MR drives, due to ship in the first quarter of next year, will be able to store 200M bits of data per square inch and will eventually exceed 400M bits of data per square inch. Volume pricing for a 5.14-GB MR drive is estimated at \$1,565.

LAN Manager upgrade ready
MicroSoft Corp. announced immediate availability of an upgrade for LAN Manager Version 2.60 and higher to Windows NT Advanced Server. The product is said to smooth the transition with automated tools and on-line Help. Pricing is \$600.

NetWare release

Novell, Inc. has begun shipping its NetWare for SAA Version 1.30 with run-time versions of NetWare 4.01 and 3.12. NetWare for SAA is a gateway that lets NetWare clients access IBM hosts.

Open/Image put to use
Wang Laboratories, Inc.'s Open/Image imaging software is being used in new manufacturing applications released by Efficient Management Systems, Inc. in Milwaukee and Karsner & Associates in Glen Burnie, Md.

Digital and US West deal
Digital Equipment Corp. has chosen by US West Communications, Inc. to supply Alphas AXP-based video server technology for use in a broadband communications trial that US West is planning for next year in Omaha, pending approval by the Federal Communications Commission.

Digital, which is seeking similar deals with other telecommunications companies, said its equipment will support video-on-demand and other interactive programming for the US West trial. The Internet/TV capabilities are scheduled to be provided by The SDO Co.

Features Some Significant Pluses

Introducing the SAS/C C++ Development System from SAS Institute. Another first from the first—now offering C++ programming tools for the IBM mainframe environment.

A Plus for Productivity

C++ is an object-oriented superset of the C programming language that makes program development, use, and maintenance easier and more efficient. Now, with the SAS/C C++ Development System, you can open the door to object-oriented programming on your IBM mainframes under AIX, OS/390, VM, and VME/VACs while preserving your existing investment in C applications.

The SAS/C C++ Development System is fully compatible with the AT&T 3.0 release of the C++ language and provides extensive compatibility support. It implements the fundamental constructs of the C++ programming language—including inline functions, operator and function overloading, new, delete, and dynamic memory management—providing a robust and productive applications development environment.

The enhanced SAS/C Full Screen Debugger, available with the SAS/C Development System, allows you to debug C++ as well as mixed C and C++ applications.

A Plus for Portability

The SAS/C C++ Development System is an indispensable tool for migrating existing C++ applications developed in other environments. Applications developed in workstations and PCs can be ported to the mainframe with minimal effort. As a result, your workstation becomes an effective platform for mainframe applications development.

Find Out More In A Free Report

Comshare strengthens Excel link

By Michael Vizard

Comshare, Inc. in Ann Arbor, Mich., this week will launch Version 2.0 of its Commander Financial Data Control (FDC) software, which will add Windows support and tighter integration with Microsoft Corp.'s Excel spreadsheet.

Based on the same multidimensional database used in Comshare's Commander Prism executive information system, FDC is a consolidation and reporting tool tailored to financial managers who need to analyze data stored in any Bri雗e database. FDC will be announced at the Comshare user's conference in Dallas.

Using query tools that Comshare has added into Excel or Lotus Development Corp.'s 1-2-3, these managers can download data from a Bri雗e database into the Comshare database, where it can be analyzed by client systems using a variety of drill-down tools provided in FDC.

In the background

To facilitate gathering that information, FDC can be run as a background task until the data is downloaded from the Bri雗e database.

Among the companies adopting FDC 2.0 is truck manufacturer Freightliner

Using query tools that Comshare has added to Excel and 1-2-3, financial managers can download data from Bri雗e to a Comshare database, where client systems analyze it using a variety of drill-down tools provided in FDC.

PowerBuilder tools from Powersoft Corp. and Microsoft's Access relational database, according to information systems analyst David Sizner.

However, while Freightliner will work with the current version of FDC, Comshare said it plans to deploy FDC running in conjunction with the SQL Server relational database from Microsoft, as opposed to the Bri雗e databases currently supported by Comshare.

According to Comshare officials, the company will accomplish this initially by supporting Microsoft's Open Database Connectivity interface, which will be followed by plans to more tightly integrate the Comshare multidimensional database with SQL databases.

An FDC site license is priced at \$120,000.

Chase

CONTINUED FROM PAGE 49

bandwidth capabilities will likely catch on in trading-floor environments in the next few years as the technology matures and standards are enacted. "For the most part, trading floors are pretty much running at capacity in terms of their data feeds," Williams said.

While visions of fast-packet switching dance in the heads of Chase technologists, quick and easy access to market data is the bottom line for its traders, who last quarter handled a bank record \$186 million in trading volume.

"We're not interested in how the feeds are made or what the equipment consists of as long as the information we need gets to us," said Kathryn O'Donnell Galbraith, a Chase executive vice president responsible for the bank's global capital markets activities.

Global village

In an attempt to address the increasing global nature of the capital markets it invests in, Chase last summer consolidated its international and U.S. capital markets operations into a single reporting structure.

To meet the global information technology requirements of its investment managers, Chase needed faster, more flexible graphical user interface (GUI) and analysis tools that would simplify the value of investments to investors, according to Galbraith.

"Our investment managers have to be able to interface with our investors, and they can't do that without state-of-the-art technology on the desktop to break down and simplify the relative value of

Module facilitates storage for word processing files

By Michael Vizard

BRS Software Products, a division of InforPro Technologies, Inc. in McLean, Va., this week added support for a word processing document conversion module to its text-retrieval database.

Offered under a reseller pact with Keyword Office Technologies Ltd. in Calgary, Alberta, the module is intended to allow word processing users to access any document stored on a BRS/Search database regardless of the document's original format.

In addition, the BRS/Search database can be linked to SQL databases.

The module supports more than 20 word processing applications running on either DOS, Windows, Macintosh, Unix or OpenVMS platforms. The BRS/Search engine runs on Unix or Novell, Inc. NetWare servers.

Pricing starts at \$750 for a stand-alone version of BRS/Search.

the investment," she said.

To meet those and other trading-floor requirements, the bank is developing an Open Software Foundation (OSF)-based graphical front-end package called Chase Advanced Trader Systems (CATS). CATS was designed

to provide Chase traders with access to several Sybase, Inc.-based trading databases — including those used to house data for capital markets, commodities, derivatives, foreign exchange and treasury — while maintaining a consistent look and feel among different environments, according to William E. Schimeler, a Chase vice president.

CATS is slated for full production in Chase's first-for-each-exchange trading division, said Schimeler. The new tool, GATS, is implemented in other trading areas will follow shortly thereafter.

CATS "is more integrated

than what exists today and

will provide us with more

and faster analytical tools,"

Galbraith said.

For example, only 115 of Chase's 450 New York traders are currently equipped with Sun workstations. Furthermore, Galbraith said, most of the market analysis handled by Chase traders today is conducted — after the trades are made — on VT100-type terminals linked to a Digital Equipment Corp. VAX computer.

In contrast, the CATS system, he said, will enable the bank's brokers to analyze its trades on the fly with additional Sun SPARCstations running Tektronix Soft-

ware Systems, Inc. market data distribution software under Motif/GUIs.

The Sun workstations being installed on the trading floors here will be linked to one another over TCP/IP LANs.

Chase's trading floors in New York and London are connected to the bank's back-end IBM ES/9000 mainframe in Bournemouth, England, via T1 connections, according to Gordon Davies, a Chase vice president.

Decision time

Chase plans to decide on an ATM hardware vendor in the next two months but will likely wait until the technology matures and standards arrive before deploying the backbone devices in 1995, according to Schimeler. Between the time the trading floor goes into full production by November 1994 and that 1995 date, an Ethernet-based Fiber Distributed Data Interface backbone will support data distribution.

Chase is also planning to equip its New York and London traders with desktop-to-desktop videoconferencing capabilities. To date, only a handful of brokerages have addressed videoconferencing on their trading floors, including Morgan Stanley & Co., Moore said.

Chase expects to choose a videoconferencing software vendor by early next year, Schimeler said. In the meantime, the bank is testing software from Insoft Communicate. Moore said desktop videoconferencing systems typically cost about \$15,000.

The goods

Chase Management has identified four key strategic business requirements for its forthcoming distributed trading environment to address:
• Identify trading opportunities
• Capture transaction-specific information
• Help the bank manage trading positions in fluctuating markets
• Understand the exposure and opportunities the new environment creates.

Workgroup Computing

Epoch Systems, Inc. has announced Epoch Enterprise Backup, a client/server backup/restore product that accommodates PC-based platforms, relational databases and Unix file systems across the enterprise.

Epoch Enterprise Backup can be used for PC LANs, stand-alone or networked Unix workstations and servers and mainframe storage subsystems. According to the Westboro, Mass., company, support for all LAN client/server environments with Novell, Inc. NetWare clients is provided.

Features include intelligent schedule management, comprehensive reporting, heterogeneous client support and data-base backup support.

Epoch Enterprise Backup pricing ranges from \$2,200 for five nodes up to \$50,000 for 500 nodes.

►Epoch Systems
(508) 636-4300

XDB Systems has introduced a distributed relational database architecture (DRDA) server for the desktop.

According to the Laurel, Md., company, the XDB-DRDA Server enables a DB2 for MVS, DB2/VM (SQL/DS) or SQL/400 application to initiate a dialogue to access data stored on an XDB-Server database running on a desktop, LAN or "mobile computer" via the DRDA protocol.

The process of importing and exporting data to and from the LAN is controlled by features that include security, audit, job scheduling and report distribution.

Third-party proprietary middleware is not needed, and application developers can use standard SQL requests.

The XDB-DRDA Server requires 200K bytes of RAM on a 386- or 486-based microcomputer.

Pricing is \$5,500 per user, \$12,000 for 10 to 50 users.

►XDB Systems
(301) 317-6800

PlanView, Inc. has introduced Version 2.0 of PlanView, Windows software for client/server work management solutions.

According to the Austin, Texas, company, Version 2.0 builds on the functionality of previous PlanView products and adds the ability for various classes of users to interact in the database, including work sponsors or requestors, functional, project or executive managers and time reporting staff.

Pricing ranges from \$1,800 to \$4,200 per concurrent user.

►PlanView
(512) 349-8800

SunSolutions has introduced ShowMe 2.0, a desktop videoconferencing product that lets workstation users collaborate interactively with video, audio and screen-sharing tools in real time.

According to the Mountain View, Calif., company, ShowMe 2.0 lets users display, discuss, annotate or edit images, documents and video, as well as share applications via a graphical user interface.

Version 2.0 consists of ShowMe View, ShowMe SharedApp and ShowMe Whiteboard.

Pricing starts at \$3,270.

►SunSolutions
(415) 336-4567

ICL has announced several additional features for its DRS 6000 300 series of Unix servers.

According to the Irvine, Calif., compa-

ny, these enhancements include a new technology enabling the maximum memory limit to be increased to 512MB bytes and a 40-MHz SuperSPARC processor module that provides power upgrades.

The 300 series includes two I/O controllers and a dual SCSI-2 adapter.

The products come preinstalled in DRS/NOX Version 7.8, which is ICL's implementation of Unix System Laboratories, Inc.'s Unix System V Release 4.2.

Pricing ranges from \$6,900 to \$30,600.

►ICL
(714) 855-5500

MTI has announced StingRay II, a storage server technology designed to meet the I/O demands of CPMs such as Digital Equipment Corp.'s Alpha.

According to the Anaheim, Calif., company, the StingRay II offers an advanced algorithm cache that supports up to 1.8GB bytes of high-speed dynamic RAM. The results are said to be performance-rated at 3,600 I/Os per second and a bandwidth of 128MB bytes/sec.

StingRay II offers 160 MIPS of processing power for ultrahigh speed and performance. Other features are load balancing with the parallel processor.

Pricing begins at \$25,000.

►MTI
(714) 970-0300

NCR Corp. has announced the NCR 7450 retail workstation, a point-of-sale system.

The NCR 7450 features NCR's Dynkey technology, a combined display and keyboard that assists users through a transaction.

The workstation provides a key lock control for security and printer support. The NCR 7450 is an open systems-based

workstation that can run Windows 3.1, MS-DOS 6.0 or OS/2 2.1.

According to the Dayton, Ohio, company, the product complies with the U.S. Environmental Protection Agency's Energy Star program.

The NCR 7450 is priced starting at \$2,995.

►NCR
(513) 645-5000

The RBS Group, Inc. has introduced Softrax integrated business software.

According to the Braintree, Mass., company, the product is Unix-based and hardware-independent. It can track installations, support calls, licenses, prospects and inventory and process orders.

Softrax is priced at \$1,000 to \$1,500 per user.

►The RBS Group
(617) 849-3327

Product shorty

Pixelink Corp. has introduced OS/2-compatible high-resolution displays, options for its 120XMS Xelerated document-imaging systems running 17-, 20- and 21-in. color monitors. The systems can display 256 colors at resolutions up to 1280 dots.

The Pixelink 120XMS runs under Windows 3.1 and Unix/X Windows System host systems. Cost: \$4,995. Pixelink, Hudson, Mass. (617) 262-4805.

The Mark Williams Co. has introduced Release 4.2 of the Cobalt operating system. Features include the ability to run more than 50 third-party software packages, a Unix System V-style print spooler and support for SCSI and floppy tape drives. Cost: \$99.95 for one to four users. Mark Williams, Northbrook, Ill. (708) 291-6700.

**BRANCH office
CONNECTIVITY
is FINALLY
within REACH**

Until today the prospect of integrating a branch office into your corporate network has always seemed hopelessly far off. There are now unparalleled connectivity solutions that bring your branches and headquarters much closer together.

Eicon Technology, a world leader in PC-based connectivity, offers a family of internetworking and host access products for linking remote offices along with some of the best 3270, 5250 and APPC emulations

for use on your favorite PC platform. Eicon's new InterConnect Server extends your Cisco, Wellfleet or IBM backbone network across the enterprise. It fuses traditional router and gateway technologies by integrating LAN interconnection for Novell NetWare and TCP/IP networks, access to any host, as well as conversion and concentration of non-LAN communications—all supported by comprehensive SNMP network management.

So, if you are interested in connecting your branch offices—whether they are in San Francisco, New York, or anywhere else in the world—call 1-800-80-EICON for the Branch Office Connectivity booklet.

TECHNOLOGY

WAN gives focus to World Vision Connectivity software helps channel resources to relief

By Joanie M. Wexler

Sometimes a simple technology can translate into benefits that transcend plus signs on the bottom line of a financial statement.

In the case of World Vision Canada, a partner with World Vision International, a global nonprofit relief organization, communications software linking remote PC users to a central database and LAN-like services on an IBM AS/400 is ultimately helping channel more resources into food, training and care for needy Third World countries.

One way Package/PC software from Telepartner International in Farmington, Conn., is helping around the world by beefing up the ability of Toronto-based World Vision Canada fundraisers to quickly extract and manipulate key information from a host database to encourage donations, said Michael Bolvin, technical analyst.

It is also streamlining operations by letting remote users become IBM OfficeVision participants. This eliminates much faxing and other manual processes and transfers funds out of the operations area and into relief aid, World Vision said.

Without the package, which the organization installed about six months ago in its 30 small offices throughout Canada, fundraising users could only perform terminal emulation and were unable to access LAN services, such as remote printing, that are available with the IBM PC Support software that comes bundled with the AS/400 operating system.

Package/PC, however, extends the function-

World Vision Canada President Don Scott holds Ali Mohammed, 4, at a hospital in Mogadishu, Somalia

ality of PC Support to asynchronous dial-in users over X.25 packet-switched lines and precludes the need for terminal emulation hardware, Bolvin said.

"Terminals were just too expensive, because you have to buy a terminal controller that costs

World Vision, page 64

Distributed systems

Managing costs proves difficult

By Thomas Hoffman

Many organizations have drawn quantifiable benefits from moving data and applications into the hands of end users via geographically distributed systems, such as improvements in customer service response times.

But the ability to gauge the costs of ownership and support for these widely dispersed systems are often elusive and difficult to manage, according to a recent study compiled by Business Research Group (BRG), a market research firm in Woburn, Mass.

For example, according to the BRG white paper "The Cost of Geographically Distributed Computing," more than 70% of information systems executives surveyed at 190 U.S. organizations said remote network management has become a critical concern for their companies.

"That's a topic near and dear to my heart right now," said Maria Krausman, a manager of technical services at Trumbull Pond's USA Co. in Trumbull, Conn.

The company is involved in several networking projects right now, including the establishment of a frame-relay connection between its Trumbull data center and Jefferson City, Mo., manufacturing plant. The connection is planned for completion by the end of this month.

Training issues

A key element in the cost of computing is training. Users told BRG that they are spending between \$1,700 and \$14,700, depending on platform, over the course of three years.

A closer look

Kevin O'Neill, vice president of research and consulting at BRG, said the firm used the survey to look more closely at some of the hidden costs of geographically distributed computing, such as training.

"What we found is that you really have to take a look at the costs of maintaining these environments throughout their life cycle."

Managing costs, page 60

Client/server E-mail comes in from cold

By Lynda Radosevich

ISA Corp., a systems integrator in Edmonton, Canada, last week introduced client/server electronic-mail software for the Internet and Open Systems Interconnect (OSI) networks.

Originally developed for the city of Edmonton, the software has three service components that run over both TCP/IP and OSI transport protocols: message handling services, directory services and library services.

The server software runs on major Unix platforms, and client software runs on Windows, Macintosh, DOS, OS/2, Unix and Microsoft Corp.'s Windows NT-based computers.

Called Enterprise Communication Services, the product is different from market-leading file-based E-mail systems such as Novell's GroupWise or CC-Mail and Microsoft's Mail in that the mail access protocol directly accesses the network protocols rather than writes to files on a network drive.

The result is that the workstation can

operate independently and users can access messages from any geographical location as long as there is a TCP/IP or OSI network around, according to Steve Hole, director of research and development at ISA. Unlike plain internet mail, the client software has a graphical user interface and is available on non-Unix platforms, he added.

The software is at the heart of the WinterNet, an information exchange program developed by the city of Edmonton for the International Winter Cities Association. The association consists of cities that have a mean January temperature of minus five degrees Celsius. Using WinterNet, municipal employees can share information on winter technologies, such as snow removal compounds. The city of Edmonton is rolling out WinterNet to 290 municipalities.

What Edmonton began developing the WinterNet in 1990, no commercially available software met its needs for international standards-based communications and user-friendly PC interfaces, said Joni Minas, director of systems for

WHY IS IT COMPONENTS INCLUDE

- For listing municipal staff responsible for managing local operational activities.
- For listing government departments, individuals and organizations that provide services to municipalities.
- ■ ■
- For the exchange of information.
- ■ ■
- For conducting discussions with various groups and organizations.
- ■ ■
- For searching and receiving multimedia documents and reference material.
- ■ ■
- For information on the operations, equipment and technologies of municipalities around the world.

the city of Edmonton.

"The problem with using CC-Mail and Microsoft's Mail is they are local, not enterprise-based, and it was difficult to connect up the networks. And the Internet is wonderful, but it is designed for fairly sophisticated users," Minas said.

So the city hired ISA to develop Enterprise Communication Services. The E-mail software uses the Interactive Mail Access Protocol, a prototype standard that is expected to reach full Internet status soon; the Simple Mail Access Protocol; and the Multipurpose Internet Mail Extension. The global directory service is based on the X.500 protocol and internet Lightweight Directory Access Protocol (LDAP).

The city wanted to run OSI and Internet services over one network type, Hole said. Because TCP/IP networks are so much more common, the developers decided to run the OSI protocols on top of TCP/IP. To reduce the overhead, they used the LDAP which is a slimmed-down version of OSI for TCP/IP networks, he explained.

Enterprise Communication Services is available now from ISA; however, pricing information was not available.

NOW THE ADVAN ARE EASIER THA

STAGES OF cc:MAIL IN NEVER TO GRASP.

EVERYTHING YOU NEED TO GET YOUR BUSINESS, OR WORK GROUP UP AND RUNNING ON cc:MAIL IN ONE BOX.

If you thought e-mail was out of your reach, think again. Introducing the Lotus[®] cc:Mail Group Pack[™] for Windows[™]. A complete e-mail system, including licenses for 10 users, that's not only easy to buy, but easy to install and use.

RULE-BASED ARCHITECTURE GIVES YOU COMPLETE CONTROL.

The cc:Mail Group Pack includes both DOS and Windows versions of the world's most popular e-mail system. With Windows cc:Mail's

A full range of SmartIcons[™]—including a spell-checker and a powerful search feature—makes cc:Mail incredibly easy to use.

advanced rule editor will filter your mail according to priorities you designate. Furthermore, it will reroute or file incoming mail, and handle outgoing messages per specific criteria set by you. And with a user friendly interface, including spell-checker, and flexible search options anyone can feel comfortable commanding this powerful e-mail system.

IT DOES FAR MORE THAN DELIVER YOUR MAIL.

cc:Mail Group Pack also includes the new Lotus Organizer[™] 1.1 for Windows. This top-rated Personal Information Manager has been designed to automatically perform group scheduling for you. A task which used to take hours now takes minutes. Just enter a suggested time for a group meeting and Lotus Organizer will consult your co-workers' schedules and tell you if they're available. And it does this without revealing personal schedules.

And cc:Mail[™] is designed to grow effortlessly as you do. Easily accommodating as many users as you have, across as many platforms as you use—DOS, Mac[®], Windows, OS/2[®] and UNIX[®].

IT ALL ADDS UP.

Now you can get started with the most advanced e-mail available. The system rated easiest to learn and use by the National

Lotus Organizer 1.1—the same product that makes it easy to organize your day now makes it easy to schedule group meetings.

Software Testing Laboratory. With the Group Pack you get the full-featured, unabridged version of the Fortune 500 standard in e-mail. It also includes licenses for 10 users and the new Organizer 1.1 for Windows. All in one box. And all at a very affordable price.

Lotus now puts the power of the e-mail system well within everyone's reach. The cc:Mail Group Pack. Pick it up at your Lotus Reseller. Or call 1-800-448-2500 for more information.

Managing costs proves difficult

CONTINUED FROM PAGE 57

cles," O'Neill said. "Some of these environments — like early revisions of NetWare and different types of Unix — are manpower-intensive, and many organizations with multiple remote sites don't have the [people or] resources to manage them."

Finding a balance

Further complicating the issue, O'Neill said, is that most IS managers walk a fine line trying to balance the proper technical skill sets of their staffers while their departments are continually forced to

downsize. Survey participants were required to have at least seven remote sites with connections to legacy systems, O'Neill said.

One common concern among IS managers, he said, was the lack of mature software tools to help them administer and manage distributed environments, whether locally or remotely.

O'Neill said many of the ancient network management and distributed systems management tools show promise, such as IBM's NetView/6000, Hewlett-Packard Co.'s OpenView and Computer Associates International, Inc.'s CA-User center. But, he said, the deployment of these products to manage mission-critical applications over the next several months and the resulting user feedback will determine their mettle.

Measuring resources, costs

Gauging the costs and resources required to manage distributed systems has been a trouble spot for Patrick B. Carney, director of IS at ABB Power Generation, Inc., in North Brunswick, N.J.

"It's great to have distributed applications, but I'm not sure the management of those applications always follows. That's a hidden cost most companies aren't aware of," said Carney, whose shop runs several Novell, Inc. NetWare LANs between its offices in New Jersey and Richmond, Va. [CW, May 17].

The BRG report examined the costs of distributed systems ownership in four primary network operating system categories: NetWare, Unisys Corp.'s CTOS, IBM's LAN Server and several Unix environments.

In nearly all of the survey findings, the Unisys CTOS environment proved to be the most cost-effective.

Although Unisys commissioned the BRG study, the survey was handled objectively, according to O'Neill. "We surveyed 40 to 50 sites for each of the four environments and we gave no hint of who sponsored the study or what the other environments were," he said.

The average annual cost of supporting administration and maintenance at distributed CTOS sites came to \$25,322 per site. The annual cost of supporting distributed NetWare sites averaged \$37,390 per site.

Those figures came as no surprise to Dirk Faegre, a systems administrator at Concord General Mutual Insurance Co.

in Concord, N.H., which runs a large CTOS network. "The reliability of this equipment is just amazing," said Faegre, who said his annual network maintenance costs run close to zero.

Staying the course

Though Faegre said he would like to see more third-party CTOS applications on the market given what's available for the DOS and Windows environments, he said his company's analyses of OS/2, Unix

and Microsoft Corp.'s Windows NT operating systems fell short when compared with CTOS.

In fact, he said CTOS' resilient client/server capabilities are head and shoulders above other systems he has seen. Faegre said he would rather stick with CTOS than follow the latest client/server technology craze.

"I can see the lemmings walking over the cliff, and I don't want to be any part of it," he said.

When we asked our engi

Introducing Matrix UPS Modular protection for the client/server WAN

The challenge: eliminate the tough installation, burdensome service contracts, high lifecycle costs and threat of a single point failure that plagued existing midrange UPSes.
The solution: Go to pieces. Package premium power protection in an innovative modular design.

Matrix modularity means reliability. In some midrange UPSes, a small internal failure can bring down the whole UPS, and your system with it. In contrast, the Matrix "100% Uptime" design isolates any problem to their "block" which can be diagnosed and hot swapped-out while the protected system stays up and reliable.

No downtime. No service delays. No unnecessary risk. The fact is, Matrix delivers plug-and-play reliability no other UPS can match.

Matrix modularity means low lifecycle costs

When you're right-sizing to conserve cash, the last thing you need is a UPS that wastes it. Matrix modularity doubles expected battery life, saving you replacement costs, and operates at 93% efficiency, so you save electricity and cooling costs as well. In fact, over a 5 year lifecycle, Matrix costs up to 60% less than same-sized UPSes... savings you can't afford to ignore.

Provides unmatched power protection and full VA capacity of multiple loads, even while in bypass.

Unlike older frame-based designs, Matrix is compatible with servers which employ power distribution units (PDU) bypass. Standard 3-wire 10kW input means no re-wiring.

See new Matrix UPS in action...

Yes, I'm interested in a free video of Matrix UPS modular protection for the client/server/WAN.

Patent searching gets faster

Advanced text searches could appeal to large corporations, law firms

By Lynda Radosevich

For organizations looking to research patent information, Rapid Patent in Arlington, Va., and Electronic Data Systems Corp. in Dallas will announce this week

an information service said to expand and speed up patent searching.

Called the Patent Analyzer, the service is expected to appeal to large corporations and law firms. It allows advanced text searches rather than the simple key-

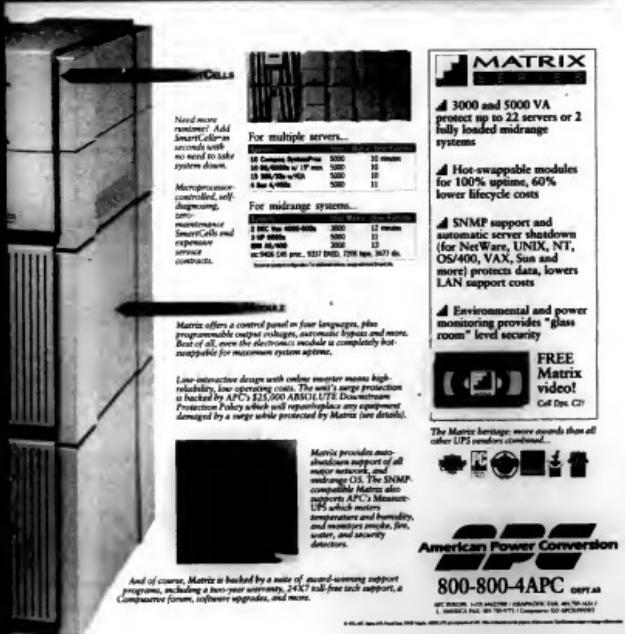

word and Boolean searches that other electronic patent-searching services provide, according to Michael Toohey, president of Rapid Patent.

For example, users can scan a drafted application into the Patent App-

byer, and the system searches all of the document's words against the 1.7 million patents in a database containing 20 years' worth of patent records. The system then statistically determines which patents are most related.

Ivor Kalkline, a project manager at Hamilton Consultants in Cambridge, Mass., said that a simple Boolean search misses much of the related patent information because lawyers who author patents try to avoid using standard terms in order to keep their patents as narrow as possible.

neers for a midrange UPS
30% lower lifecycle costs,
to pieces...

"The more the true meaning is obfuscated, the more likely that the unique aspects are harder to find," Kaklitsis said.

Now, when companies need sophisticated patent searches, they typically hire expert patent searchers who manually search through boxes of paper-based patents stored in the U.S. Patent and Trademark Office in Arlington, Va.

"Until recently, the patent world was one of the least automated and least 20th-century information-rich industries there is," Kaklina said.

Whether the wall

Vendors such as EDS and the patent office plan to change this [CW, Nov. 1]. Patent Analyzer will cut the three-to-four week turnaround time of a manual search to 48 hours, Tooker said.

EDS is providing the processing power to complete the mammoth searches via an in-house system that has been in development since 1985. The system has 32 parallel processors and parallel processing database software, also developed in-house, according to Carl Waite, division manager at an EDS research and development division.

The Patient Analyzer is currently available for customers making requests by fax or phone. Next year, Rapid Patient plans to add remote access via dial-up and dedicated workstations.

Pricing ranges from \$45 to \$495, depending on the service, which is roughly equal to manual search costs, Toohey said.

The truth about

Before you decide what client/server platform is right for you, make sure you know what's true, and what's Not True.

Fact: the OS/2® client/server solution preserves your current hardware and software investment,

 accessing your mainframes, minis and PCs when necessary and bringing their power and capacity to the desktop level. Fact: the Windows NT™ solution is based on PC servers and desktops and doesn't embrace all your existing resources. That could mean porting applications and data. The only plus that offers is the cost of porting plus the cost of additional PC servers.

Fact: OS/2 2.1 runs DOS, Windows™ and more than 1,200 OS/2 applications. With LAN or Novell® NetWare,™ OS/2 supports Windows, OS/2 and Mac clients. It is not likely NT will support all your existing applications. It won't run existing 32-bit applications like WordPerfect® 5.2 for OS/2 and Lotus' 1-2-3™ for OS/2. It will require additional software to support DOS, OS/2 and even Windows clients. Worse yet, *Infoworld* sources

The OS/2 ► client/server solution exploits your existing hardware and software investment. There's No Telling how much the NT solution could cost you.

▲ All this monkeying around with NT raises lots of questions. OS/2 has the answers.

report that Windows 3.x applications run 20% slower under NT than they do under OS/2 2.1!

Fact: OS/2 delivers powerful, reliable, client/server applications for data storage and retrieval (DB2/2™, Oracle 7™, InfoPump™), communications (Communications Manager/2, REMOTE OS™, TalkThru™), transaction processing (CICS, IMS Client Server/2 V2), comprehensive network management (LAN NetView™, CA-UNICENTER™)

client NT

Domain/DACS," AlertView," Foundation Manager"), and more. Fact: The NT strategy is still Not There, and neither are native client/server applications.

Fact: OS/2 is committed to the industry-accepted Distributed Computing Environment (DCE) standards of the Open Software Foundation.

Fact: NT is Not.

Fact: NT still Needs Time to

Version 2.1

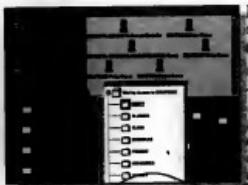

wide. It's the leading, second generation, 32-bit Intel®-based operating system—a more stable, more developed version of the award-winning March, 1992 release.

If you're looking for a cost-effective, secure, high function client/server solution today—Not Tomorrow—then OS/2 is for you. To order or to find out more about OS/2 2.1, call 1 800 3-IBM-OS2. In Canada, call 1 800 465-7999. OS/2 2.1 is also available at your local software dealer. And that's a fact.

Operate at a higher level.™
server.

▲Who needs first-generation slips? OS/2 is second-generation solid.

prove itself in the real world. Fact: OS/2 is used by millions worldwide. ▲With OS/2, it's full speed ahead for your DOS, Windows and OS/2 applications—there's no need to buy DOS and Windows.

THE SAS® SYSTEM FOR INFORMATION DELIVERY

CLIENT

YOU'VE GOT THE SAS® SYSTEM ON YOUR SIDE

Getting information you need to do your job shouldn't be a job in itself. Client/server computing can help.

But what if the data is not relational? Or you need to combine data from many sources? Or moving large volumes of data across your overtaxed network is unacceptable? That's where the SAS System provides the most complete client/server solution.

With the world's leading information delivery system, enterprise data—regardless of source or structure—becomes a generalized and available resource on your desktop. And when it's impractical to move data to your application, the SAS System lets you move your application (or parts of it) to the data. You can then turn that data into useful information using the #1 multipurpose choice for decision support/EIS.

BRINGING IT ALL TOGETHER IS WHAT SETS US APART

Give us a call today for your free guide, *Client/Server and Beyond*, and learn how the SAS System brings it all together for you.

Briefs

Phones to get smarts

Tandem Computers, Inc. has agreed to sell imminent VeriPhone, Inc. "smart servers" telephones to act as intelligent interfaces to Tandem servers. The phones, expected in mid-1994, will include a screen display, keyboard, modem, magnetic stripe card reader and system software for automating card-based transactions.

Eyes on the sky

Two companies with planned worldwide low-earth satellite networks recently petitioned the Federal Communications Commission to

accelerate the licensing process for this technology. Motorola Satellite Communications, Inc. and Loral Qualcomm Satellite Services, Inc. filed a joint proposal with the FCC.

No. 43786, call home

The city of New York's Department of Corrections has introduced the Automated Inmate Call Management System, a computerized telephone program that will allow inmates at Rikers Island to make calls at their own expense. Inmates will be able to draw from their commissary accounts to pay for telephone calls using personal-coded bar codes stamped across their identification cards and personalized identification numbers.

World Vision

CONTINUED FROM PAGE 57

thousands of dollars to link—in our case just one or two terminals in each remote location" to headquarters, Bolvin explained.

According to Tim Mills-Groninger, program director of the Information Technology Resource Center, a consultancy for nonprofit organizations in Chicago, most organizations such as World Vision can put together LANs out of the box, "but WANs are trickier. There are not yet a lot of standards," and [telecommunications] costs are not well-understood" by these organizations. Many nonprofits "come in through the backdoor" by developing a LAN and then installing remote access, he said.

Bolvin said not having a product like PackagePC diminishes the ability to have information on hand for donors, such as what is happening with a child they are sponsoring, where their money is going and what World Vision is doing to deliver it. This can get an organization "the reputation of being fly-by-night," which hurts donations and their eventual beneficiaries, he said.

In World Vision's case, these are largely needy children in underdeveloped countries. The care and feeding of donors, which is increasingly dependent on database and communications technologies, is the path to delivering famine relief, medicine, shelter, training and other aid.

To get a better grip on donor-related information, World Vision Canada used its eight full-time developers and brought in another 10 to develop a customized database called the Donor Centered Support System, which houses

child and World Vision project histories and manages marketing, donations and receipting for tax purposes. It was developed under a fourth-generation language program called AS/400 from Systems Software Associates in Chicago.

Quick answers

Having better interactive capabilities with the host "is a great help, because if a donor has a question, I can have the answer in less than a minute," said system user Paul Huston, the 30-Hour Famine Representative for World Vision's Eastern Ontario territory, based in Kanata. The 30-Hour Famine project is a pledge-based "starvation," in which participating students raise money for hungry children.

In a development environment, "access to accurate, timely information by people who need it, regardless of location, is a benefit that leads to less overhead and better solicitation of resources; fundraisers can target prospects better and have more accountability," Mills-Groninger said.

Currently, individual World Vision partnerships do not access each other's databases directly, though Bolvin said a need is emerging to get faster information via automation.

For example, Huston cited the recent earthquake in India. "The more quickly people know World Vision activities and status in a disaster, the more quickly they can react with a donation."

However, there is an interoperability problem in that "we're all on different platforms in all the countries," Bolvin said. Canada, though — which Bolvin said tends to set the information systems pace for the whole organization — is looking to port its home-grown applications to C, which would render it available for other platforms.

Enterprise Networking

Xypex, Inc. has announced the 3350-Fiber Distributed Data Interface (FDDI) Concentrator, an eight-port, fixed-connectivity FDDI hub.

Interfaces for standard fiber-optic cabling or low-cost twisted-pair wiring are available with the product. According to the Bedford, Mass., company, the concentrator was designed to connect powerful network servers and "power users" who use high-speed workstations that produce a lot of network traffic.

The hub offers configuration options that include single or dual attachment to an FDDI backbone or dual bonding.

The product provides a Simple Network Management Protocol (SNMP) agent that enables full network management from any SNMP-based management system.

The 3350 FDDI Concentrator with fiber-optic interfaces costs \$8,750; the 3350 with copper interfaces costs \$6,750.

► *Xypex*
(508) 264-9900

LANQuest has introduced FrameThrower, a multi-protocol packet generator for testing bridges, routers and hubs.

The product was designed to address the need for fast, affordable network component testing and performance analysis.

FrameThrower provides traffic generation capabilities and can generate high packets-per-second output.

According to the San Jose, Calif., company, a single FrameThrower can fully saturate an Ethernet network by mixing as many as 1,000 combinations of protocols and packet sizes in a single transmission script. A sample library of protocols and protocols is provided.

FrameThrower supports Ethernet, Token Ring and Fiber Distributed Data Interface networks and runs on any IBM-compatible host PC.

Prices range from \$1,095 to \$5,905.

► *LANQuest*
(408) 894-1000

Alecom Corp. and TRS Technologies have announced a software link integrating Alecom's LanFax Gateway fax server with several software packages. They include Lotus Development Corp.'s CC-Mail and WordPerfect Corp.'s WordPerfect Office 4.5, Microsoft Corp.'s Microsoft Mail and any Message Handling System-compatible electronic-mail system.

According to the Mountain View, Calif., company, FaxMail Gateway enables users to achieve greater returns on their networking investments by extending the functionality of their E-mail systems and LanFax Redirector servers.

The product offers compatibility with popular network operating systems, multiple inbound routing methods and the ability to handle heavy fax traffic.

The FaxMail Gateway package costs \$995 for up to 50 users and \$1,995 for an unlimited number of users.

► *Alecom*
(415) 694-7000

Micro-Integration Corp. has announced the 5250 Local Gateway for Windows.

According to the Cumberland, Md., company, the product is a local gateway that lets LAN workstations access IBM's AS/400 or Systems/38 hosts under DOS or Windows, with or without PC support.

On the same gateway, users can combine DOS and Windows sessions. To take advantage of increased speed and flexibility, users can also configure the network interface at runtime to Banyan Systems Inc.'s Vines, Novell, Inc.'s NetWare or NetBIOS network protocol.

Supported Windows features include Dynamic Data Exchange; configurable, sizable and TrueType fonts; a flash pad to activate frequently used functions or macros; hot spots to select options from the screen; copy and paste; and Paste Link.

The product costs \$2,495.

► *Micro-Integration*
(301) 777-3397

Digicom Systems, Inc. has introduced Sound Connection, a software-upgradeable sound card and modem card.

According to the Milpitas, Calif., company, the device mixes 16-bit stereo audio and 14.4K bit/sec. data/fax/modem functions on a single internal PC card using advanced Digital Processing technology.

The product is fully software-upgradable, enabling users to dial into Digicom's bulletin board service to receive recent audio and modem code revisions.

Other features include a built-in speaker for line monitoring, auto baud and automatic speed negotiation, flow control selection, an extended AT command set and CCITT V.32 bis modulation.

Sound Connection costs \$299.95.

► *Digicom Systems*
(408) 262-1277

MicroAccess, Inc. has introduced the San Francisco Series family of Pentium and 486-based nonstop, fault-tolerant servers. The servers feature Advanced Network Operations Design engineering architecture.

According to the Fremont, Calif., company, the series provides an extensive range of server management systems, known as MIS Manager, that enables Simple Network Management Protocol-type elements with a Windows graphical user interface.

The standard configuration for the San Francisco 460DX dual-server, 486DX-based 66-MHz system consists of two completely redundant file servers in one chassis.

Each server comes standard with 16M bytes of RAM on each motherboard (upgradeable to 256M bytes), two 500M-byte hard disk drives, 1M byte of cache (with Optimiser caching software), two dual-channel SCSI interfaces, five network interface cards, two modems, dual video cards, two uninterruptible power supplies with 30-minute battery backup and MIS Manager software.

The 460DX dual server costs \$9,000.

THE SAS® SYSTEM FOR INFORMATION DELIVERY

SERVER

YOU'VE GOT THE SAS® SYSTEM ON YOUR SIDE

Getting the right information to the right people can be a major challenge. Client/server technology can help.

But your investment should get you more than a pricey electronic file cabinet. After all, servers are computers...and pretty powerful ones. That's why the SAS System is a more complete client/server solution.

With the world's leading information delivery system, servers not only dole out data...they serve up compute resources as well. Summarize millions of records on the server and send only the (much smaller) results to the desktop. That can mean real savings when your network strains to honor multiple requests for large data volumes. And turn data into useful information with the client/server software that meets your most challenging decision support/EIS needs.

CLIENT/SERVER SOFTWARE WITH THE DECIDED ADVANTAGE

Give us a call today for your free guide, *Client/Server and Beyond*, and learn how to bring out the best in your hardware, your software, and the people who use them.

YOU'VE ALREADY GOT 90% OF WHAT YOU NEED TO RUN THE BEST IMAGING SOFTWARE ON EARTH.

You've already made the investment. You've got people on mainframes, workstations, minis, PCs on LANs, you name it.

Now, no matter what systems you're using, Wang can give you an imaging solution quickly, easily and at prices once thought unachievable. And not just any imaging solution, but the production quality imaging solution *Computerworld's* Buyer's Survey has twice rated #1.

It's the solution a major international bank chose to reduce document access time for loan and credit applications from 45 minutes to under 30 seconds. It paid for itself in just 6 months.

It's the solution a large U.S.-based insurance company used to reduce the processing time of applications from 30 days to one.

It's the solution a giant U.S. manufacturer used to create a just-in-time maintenance program that reduced machine downtime by 25%.

It's the solution for workgroups and client/server computing based on OPEN/image and the rest of our family of integrated office software. Including OPEN/workflow, to coordinate the movement of images, data, and text throughout a workgroup; OPEN/profound, for managing catalogs of information; PACE for Open Systems, for the rapid development of image-based applications. And more.

All backed by a financially strong, refocused and redefined Wang. With positive cash flow, virtually no debt, new products, new services

and alliances with companies like Hewlett Packard, IBM, Novell and Microsoft.

Imagine having complete access to all the information in your office.

Imagine saving time, reducing costs, increasing productivity. *Imagine* all the ways you can use files that contain full motion video, voice, photographs, diagrams, data and written information. *Imagine* that it's all on the databases and hardware you have right now.

Imaging is a powerful new tool. *Imagine* it being available to you. Today.

For more information call 1-800-NEW-WANG. Our lines, like our products, are open.

Vendors push Unix to high-end machines

By Jean S. BISHOP

Something big is happening on the high end of Unix server product lines. Today's top-performing commercial Unix systems are being edged out by symmetrical multiprocessor and cluster configurations.

Some vendors even plan to build parallel processors and alternative mainframes from conventional Unix workstations.

Many Unix vendors, including Sun Microsystems, Inc. and Silicon Graphics, Inc., have already fielded symmetrical multiprocessor machines; others, including IBM and Digital Equipment Corp., plan ship symmetrical multiprocessor machines and "clustered" systems in 1984 (see chart).

The purpose of these parallel development efforts is to provide powerful servers for commercial applications, not the scientific and technical ones long associated with Unix superminis and supercomputers.

"The economics of workstations will move upscale to mainframe-class systems," said Gary Smaby, president of Smaby Group, Inc. in Minneapolis. "They will allow users who have topped out with their existing systems to migrate to higher levels of performance."

The future is not so far away. Judging from vendor demonstrations of the next level of RISC-based systems, IBM is ac-

tively marketing its SP/1 parallel processor, which can run big relational databases for commercial or scientific applications. It also recently announced its ability to link up to four RS/6000 servers in a fault-resistant, "high-availability" cluster. And, it has installed an early-release version of an alternative mainframe called the Power 4, said Phil Hes-

ters through on-line processing monitors such as CICS. Hester said. It can outpace a typical symmetrical multiprocessor machine that uses shared memory and a single copy of the operating system. And, to prevent message-passing overhead among CPUs, it is not a "distributed memory" machine that has a copy of the operating system on each RISC chip.

The Power 4 is positioned somewhere between the two commercial models, he said. "Symmetrical multiprocessing is great, but it does have finite scalability limits. For [on-line transaction processing] operations that share data, a lot of the communications overhead and latency associated with true, distributed systems becomes a limitation," Hester said. "We clearly see the demand for performance in both the technical and the commercial market-

ter, vice president of IBM's Advanced Workstation and Systems Division in Austin, Texas.

The Power 4 can support users' parallel queries against large databases and connect with IBM's MVS-based main-

technical and the commercial marketplaces."

Sun plans to sell its symmetrical multiprocessor machines as high-volume computers and to leave the high-end designs to business partners such as Cray

Supercomputers, Inc. [CW, Nov. 1]. Amdahl Corp. has agreed to resell the Sun symmetrical multiprocessor servers to accounts that have IBM-compatible mainframes. But installation of the eight-way SPARC-server 1000 or the 32-way SPARC-server 2000 will depend on whether users want to create a large integrated database or need to support multiple applications. See sidebar.

"It's going to be a question of the amount of throughput you need on the system," said Carl Bodie, manager of product marketing at Sun Microsystems Computer Corp. "The more complex your application is in terms of the amount of data, the different types of data and the number of users, the more you want to load the data into a single database."

Scalable systems

However, key Unix vendors are not waiting for widespread user demand. They are moving to build a "scalable" series of RISC-based machines that will run binary-compatible code on all platforms in the series. "Because of the Lego-block approach these companies are going to build their next-generation machines, it will be easier to custom-configure systems for certain application sets or user groups," Smaby said.

Some users said the hardware technology is arriving ahead of the software that would support centralized process-

Unix, page 66

Nielsen outsourcing plan races to the finish line

By Mark Halper
NORTHRIDGE, ILL

Sometimes, it seems that only glaciers move slower than outsourcing deals, that Plutonian yields to Hades in the time it takes to first negotiate a deal and then implement the cutover in information systems operations.

In some well-known examples, Electronic Data Systems Corp. closed its Continental Airlines deal well over a year after announcing it; The Hertz Co. signed with IBM's Integrated Systems Solutions Corp. nearly a year after word leaked out about negotiations.

And then there are the occasional time warps, like the one that kicked in after Nielsen Information Services signed a 10-year outsourcing agreement with EDS, estimated at \$400 million, in July.

By Labor Day weekend, only six weeks after the signing, Nielsen had shot down its own Green Bay, Wis., data shop, and EDS was churning 37 bytes of product and sales data into market reports for Nielsen clients out of its Plano,

Price tag

Nielsen says EDS is on a "per drive" basis, not charges per hour.

If it uses a CPU cycle or direct-access storage device, charges vary depending on:

• Time of day: 7 a.m. to 7 p.m. is most expensive.

• Nielsen Nielsen

Marketing gets discounts as usage grows. Usage by brother Nielsen and G&B options goes toward marketing discounts.

• Economics: Pricing is adjusted downward as costs decline.

Texas, data center

The press actually picked up before the signing: Nielsen issued its request for proposals in April and told candidates that it wanted the job done within an month and a half.

"We put that stake in the ground early on," recalled Richard Derr, president of Nielsen Information, a division of Nielsen Marketing Research USA owned by The Dun & Bradstreet Corp. of Parsippany, N.J.

Outsourcing analyst Cato Carpenter at Alex. Brown & Sons, Inc. in Baltimore pointed out that projects can move quickly if, as in the case of Nielsen and EDS, the goal is simply to move the customer's IS operations to a new site without major platform changes.

"It can be just like moving furniture, in a way, if the customer is willing to move quickly," Carpenter noted.

To keep things moving after Nielsen selected EDS, Derr yanked about 25 Nielsen staffers from their regular jobs to devote full-time attention to the migration. And to make sure they fulfilled their mission in a timely manner, he offered them that old reliable motivator: the almighty dollar.

"There were people who gave up their vacation, who delayed days off because they had a chance to get a monetary incentive," Derr said. "It was a team approach. If one person missed

a key deadline, the whole team lost."

Working overtime, Nielsen and EDS adjusted code, addressed software licensing issues and undertook other technical and business issues to make sure all was running by Sept. 7, Derr said.

And then there was the cutover weekend.

"We physically transported the data with Lear jets and trucks," Derr said, explaining how the company moved mountains of data tapes to Plano.

Deal has paid off

In fact, truck drivers left Green Bay on Saturday and stayed at an overnight rest area in St. Louis, waiting until Sunday morning for two-way radio confirmation that Plano was ready for them. Otherwise, they were prepared to return to Green Bay.

So far, the deal has been worth it, Derr said.

Nielsen has used EDS to speed up the time it takes Nielsen to deliver reports to its roughly 650 clients, who are packaged goods vendors to the retail industry and retailers.

In fierce competition with another information Resources, Inc. in Waltham, Mass., Nielsen sells reports that discuss how various products are faring in different stores and markets, with insights on the effects of merchandising.

Multimedia

GUI to ease AS/400 coding

By Craig Stedman

IBM plans next year to start streamlining the development of AS/400-based multimedia applications as code can be written to run directly on a PC client.

Currently, AS/400 users interested in multimedia have to develop a standard character terminal application and add a PS/2 front end via IBM's Ultimedia Host Support/400 software — a two-step approach that IBM officials acknowledge is not optimal for positioning the AS/400 as a multimedia server.

Mark Even, manager of application technology introduction for IBM's AS/400 Division in Rochester, Minn., said graphical user interface (GUI)-based tools that will eliminate the need for the first step are scheduled to be available in 1994. "We're getting away from the separate stand-alone [PC] product," he noted.

Toos net

The tools will support direct application development for PS/2 clients "to some extent," Even said. However, he indicated that it will be another two or three years before the AS/400 has a full tool set and user interface for doing native multimedia development.

Even would not comment specifically on which tools would be available first except to say that "base enablers" such as multimedia editors will be included. Rather than developing its own tools, IBM is trying to persuade third-party vendors to build AS/400 hooks into their products, he added.

Sherry Rood, MIS manager for the Minnesota Twins baseball team in Minneapolis, which has sold tickets at 30 remote multimedia kiosks to date, said AS/400 for the past two seasons, said the direct PS/2 support should ease the development process in the future.

The Twins ran into "a few little glitches" putting the multimedia from end on an existing AS/400 ticketing application, "but overall it turned out very well," Rood said. The team plans to add a video merchandise catalog to the kiosks in the next few weeks and is also working with a third-party firm to offer job listings and government services, according to Bill Maher, marketing vice president for the Twins.

Enterprise Host A Car Co. in St. Louis will likely look at tying a PS/2-based multimedia application, now in development for use at its rental sites, to AS/400 back-end servers, said Marc Cohn, senior vice president of information services.

However, he described that as "kind of a loose concept" at this point. The application, scheduled to go live in December, source IBM.

will first run under OS/2 as a pure PS/2 application.

Other AS/400 users said they have little interest in multimedia. "It's a great technology, but we don't do technology just for its own sake," said James Bailey, senior vice president of data processing at Massachusetts Financial Services in Boston.

Teresa Elms, president of Elms Information Services Group, a San Diego consulting firm, said she sees "virtually no demand" for multimedia on the AS/400 at present. "It's a push from IBM's side to make it look like they're competitive" with Unix systems in advanced technologies, she said.

Mark Peterson, director of strategic alliances at ADM Consulting, Inc. in Cheshire, Conn., said AS/400 multimedia sales will likely remain limited for at least another year. The issue is not the technology itself but the lack of immediately obvious business uses for multimedia, he added.

That is a gating factor IBM has to overcome, Even acknowledged. "The challenge is finding uses that can be justified from a business point of view," he said.

Nielsen deal

CONTINUED FROM PAGE 67

and marketing gimmick campaigns. The company gathers its information from scanned and manual data that it buys from retailers.

According to Derr, the average time of report delivery has dropped from about 15 days to about 11 days since EDS took over.

The main reason for this advance is EDS' technology wherever it leverages its stable of mainframes. EDS provides up to 1,500 MIPS of power during Nielsen's peak demand hours. In Green Bay, Nielsen's power topped out at about 700 MIPS on two IBM 3090 Model 6 computers and IBM 3900 Model 600A.

Storage at Plano is set to expand to about 100 terabytes by 1995. Perhaps one of the reasons the outsourcing project moved along so quickly was Nielsen's ambitious plans for moving to client/server computing. Completing the outsourcing logistics helped clear the way for those plans.

Derr said Nielsen has not yet decided whether EDS will play operational roles and provide PC and LAN support, for example, in the client/server scheme or whether the EDS data center will house the Hewlett-Packard Co. HP 9000 that will host the new system.

Practice operations

Before going live on EDS systems, Nielsen and its customers on two different weekends practiced sending data from Plano to client sites.

Storage at Plano is set to expand to about 100 terabytes by 1995.

"There are a lot of reasons why we did the migration," said David Truth, a senior technical specialist at BP Exploration, Alaska, Inc. in Anchorage, "but for a lot of what we do, there is a virtual [symmetrical multiprocessor] machine on the network."

Incoming work gets parcelled out to remote workstations for processing. Truth's group has more than 100 Unix workstations, including nine Unix servers. If additional capacity is needed, the BP Exploration unit is more likely to match one of its current RS/6000 Model 360 servers, Truth said.

Unix vendors

CONTINUED FROM PAGE 67

ing for distributed Unix applications, particularly software that handles job scheduling. Others said they see no immediate need for the high-end machines. Machines like Sun's SPARCcenter 2000, introduced a year ago, still provide excess capacity for some.

Users at large Unix sites are accustomed to spreading work among many workstations on a network. "Wall Street

may need to have [a symmetrical multiprocessor] on one machine," said David Truth, a senior technical specialist at BP Exploration, Alaska, Inc. in Anchorage, "but for a lot of what we do, there is a virtual [symmetrical multiprocessor] machine on the network."

Incoming work gets parcelled out to remote workstations for processing. Truth's group has more than 100 Unix workstations, including nine Unix servers. If additional capacity is needed, the BP Exploration unit is more likely to match one of its current RS/6000 Model 360 servers, Truth said.

Developments

Recent developments in the high-end Unix server arena include the following:

• Sun's September announcement of the SPARCcenter 2000.

• Cray Superservers, Inc.'s introduction of a symmetrical multiprocessor machine with up to 64 Super-SPARC processors and SunSoft, Inc.'s Solaris 2.3 operating system.

• IBM's announcement of general availability for its SP-1 RISC-based parallel server and early-release installations of its Power 4 alternative mainframe.

• Digital's October announcement that Alpha machines running the DEC OSF/1 operating system will be shipped as symmetrical multiprocessor and clustered machines starting in 1994.

• Silicon Graphics' introduction of the Power Challenge series of supercomputers, due to ship in 1994.

I know how difficult a big migration can be...

Chemical maker in brief Unix romance

After mulling solutions, Rodel elects to upgrade proprietary HP 3000

By Mark Halper
NEWARK, DEL

Before September, Rodel, Inc. had barely looked at Unix, but by the end of the month, the chemical company found itself flirting briefly with a Unix solution — though it settled on an upgrade to its proprietary Unix-like environment.

Rodel, the microchip manufacturer and other industries, was deciding how to replace its aging Hewlett-Packard Co. 3000 Model 70.

So many options
Rodel's off-on-off affair with Unix exemplifies the schizophrenic decision-making many managers endure as they sort through the cornucopia of available solutions.

The company's objective was to install a box that would run Spectrum, Inc.'s PointMan client/server order-entry software and boost communications among various Rodel sites.

Rodel data processing manager Paul Stark realized that he had pretty much made up his mind to upgrade to an HP 3000 Model 947. Unix had been out of the

question because of a perceived "lack of standards, lack of security and a lack of management tools," he said.

But at a Spectrum user conference in New Orleans in September, Stark heard a revelation that made him think twice about sticking with a proprietary solution and with HP.

What sent Stark back to the drawing board was a visit he made at the Spectrum gathering to a Computer Associates International, Inc. booth, where a demonstration of CA's Unicom systems management software relieved some of his concerns about Unix.

"I saw Unicom, which provided systems management tools and security, and at that point, Unix was a possibility," Stark said.

As it turned out, it was a short-lived possibility. During a later session at the conference, HP sales represen-

tatives reminded Stark and others that HP's road map for the 3000's MPE/RX operating system calls for adding more Unix features.

"MPE and MPE are going to merge in a couple of years into a single operating system, so I'm going to stick with what I know," Stark said.

So within a day, Stark agonized over throwing open his evaluation to a Unix implementation — a possibility that meant considering ditching HP — and then reverted to settling on a bigger HP 3000 box, the Model 947.

"It's strange, the kind of mental gymnastics you go through," Stark said.

Now Stark is readying Rodel for a December move to the 947 box.

Key to the switch will be the implementation of Novell, Inc. NetWare on the 947, which will act as the server for the LANs at Rodel's five

sites in Newark and to the wide-area network connecting to Rodel's sales and marketing office in Scottsdale, Ariz.

Eventually, the company hopes to link its foreign sales offices in Tokyo, Seoul and Munich into the system.

Limited capabilities

With its Model 70 today, the company has limited networking capabilities. Connectivity software from Walker Richter & Quian, Inc. ties PCs acting as terminals into the 3000; each of the company's 110 PCs can access information sent from another PC to the 3000.

Rodel already runs a small, 16-node Novell network, supported by an Intel Corp. i486 PC, for its engineering group. That department would be the first to tie into NetWare on the 3000, Stark said.

In tying together the PCs, Stark hopes to improve customer support by giving staffers on-line access to old invoices, shipping details or other documents now stored on paper or individual PCs.

Stark estimated the upgrade will cost about \$1 million — roughly \$100,000 for the HP3000 Model 947, about \$450,000 for a 100-user license for PointMan and about \$90,000 for installing 100 486-based PCs either through upgrades or new purchases. Stark said the balance of the cost would come from rewriting Newark locations and from retooling the company's WAN.

Are you tired of using COBOL maintenance techniques that haven't changed since the leisure suit? Would a product that answers your questions about your entire software system make your job, and maybe even your life, a whole lot better? We bet it would.

Real Analytical Power. Revolve's Windows interface lets you point and click to look at source code from many perspectives, including views of physical components, logical execution sequences, and data layouts. Color graphics give you quick insights into a program's structure.

Then Revolve goes even deeper, with a unique query capability that lets you define your own questions with no limit to their

complexity. With the answers, Revolve generates the complete blue-print you need to understand an existing software system. Because it works on many programs at once, Revolve gives you the overall view you need to understand an entire application.

Here's The Bet. If your data center needs a few simple qualifications, we'll give you a copy of Revolve. Free. Forever. This is not a "trial offer."

We're betting that once you use Revolve in your own work environment, other programmers will want a new image, too. So be the first in your shop to take the bet, and call Burl Software at 1-800-849-BURL today. You'll win a whole new image.

Manufacturing software

Planning tool links factory floor, engineering

By Ellis Booker

The widget, designed to perfection on a high-end workstation by an industrial engineer, reaches the factory only to face an engineering change before it can be built.

From an automated planning standpoint, that's when all hell breaks loose.

The change "is done either through paper or a phone call," said James M. Welman, associate partner and senior product director for industrial software products at Chicago-based Andersen.

Consulting, "That whole process can take weeks, or months...and it uses people as message carriers."

Late last month, Andersen introduced a manufacturing planning tool designed to bridge this gap between design, engineering and production activities.

Called Computer Aided Process Planning (CAPP/D), the Unix-based workstation is the latest addition to Andersen's MAC-PAC/D manufacturing software line. According to Andersen, the tool is aimed squarely at complex manufacturers such as United Technology Corp.'s Sikorsky Aircraft Division in Stamford, Conn.

In fact, Andersen jointly developed the tool with Sikorsky and two Rockwell International Corp. units: the Space Systems Division and Rockeydyne Division in Canoga Park, Calif.

Good-bye paper chase

Through the use of a variety of vertical tools, big manufacturers such as Sikorsky have managed to boost quality and reduce waste from factory design departments, Welman said.

"But we think the new frontier will be gaining competitive advantage through project data management," he said.

At Sikorsky, the software has eliminated the paper chase, resulting in quicker revisions.

"We can automatically incorporate any process changes on the shop floor on-line," said John Delaney, Sikorsky's manager of manufacturing systems. The software has been "in place for about a year and a half."

Both Sikorsky, which runs its entire manufacturing system on CAPP/D, and Rockeydyne have had the product in production for more than a year.

CAPP/D runs on IBM's RS/6000 and Hewlett-Packard Co.'s HP 9000 Unix systems. It features a graphical front end and uses a mainframe data repository. The software ranges in price from \$135,000 to \$300,000, depending on the server and the number clients.

Brief

One DB2 price fits all

Utility software vendor The DB2 Group, Inc., has given with the industry flow and abolished tiered software pricing for its Compress family of database utility packages as well as for its other software.

The Gurnee, Ill., company has instead adopted a one-price-fits-all CPU size policy. At the same time, DB2 announced it will no longer collect fees from users who want to upgrade CPUs.

Client/Server 4GLs. Open as Pandora's Box.

In today's high technology marketplace, you hear a lot of stories about proprietary 4GLs for client/server application development. Stories that lure you...that make 4GLs sound flexible, fast and open.

Beware the paradox: how can 4GLs be open when someone else holds the key?

Using client/server 4GL tools means opening Pandora's box of proprietary languages, vendor lock-in, and runtimes up to 16 times slower. With surprises like these, trusting your business critical applications to 4GLs should scare you half to death.

With KASE:VIP, you get client/server solutions in standard languages like C, C++ and COBOL. Safe, secure solutions that leverage your current investment instead of replacing it. Using interactive visual design and code generation technology, KASE:VIP delivers the rapid development and increased productivity promised by 4GLs—but without unpleasant surprises.

Don't open Pandora's box. Get the facts in our free white paper, "No Strings, Boxes, or Borrowed Time: Overcoming 4GL Dependencies with Standard Language Client/Server Development Tools."

Large Systems

Software

Sterling Software, Inc.'s System Management Division has introduced the Solve suite of systems administration products.

According to the Reston, Va., company, the suite comprises four products designed to address key information systems management disciplines: Solve: Problem, Solve:Change, Solve:Asset and Solve:Configuration.

Key functions include the ability to identify and eliminate high failure rate hardware, unreliable software and inadequate maintenance service.

The software includes an enterprise model that is common to all the Solve products.

Prices begin at \$25,000.
► *Sterling Software*
(703) 264-9000

Micro Decisionware has announced its Database Gateway for SQL/400 with IBM's Distributed Relational Database Architecture.

According to the Boulder, Colo., company, the gateway runs on an OS/2 platform. It provides users with access to IBM AS/400 from development, query and spreadsheet applications written to the industry-standard DB-Library and Open Database Connectivity application programming interfaces.

Prices start at \$18,500.
► *Micro Decisionware*
(303) 463-2706

Computer Corp. has introduced DBA-Xpert DB2 Release 3.0, which includes remote DB2 subsystem management capability.

The product enables database administrators to simultaneously access and administer multiple DB2 systems on separate CPU's from a single DBA-Xpert session, according to the Farmington Hills, Mich., company.

Features include automatic propagation of referential integrity changes to dependent keys and indexes; a fully integrated utility/direct-access storage devices management facility; a facility to import and implement new object definitions created by computer-aided software engineering tools; data dictionary tools or Dynamic Data Link tools provided with DB2 application software packages; and user-customizable job control language skeletons.

Prices start at \$49,000.
► *Computer Corp.*
(313) 727-7300

Generic Software, Inc. has announced BookReader for IBM's AS/400.

According to the Madison, Miss., company, BookReader provides AS/400 users with the ability to view and print IBM BookManager-compatible .soft cover books at any AS/400 display station.

Other features include multiple-user support and advanced, automated methods for accessing and searching books.

BookReader costs \$395 per CPU.

► *Generic Software* (601) 833-1169

Cincom Systems, Inc. has announced six additional ControlManufacturing modules for the Unix environment.

According to the Cincinnati company, ControlManufacturing is a comprehensive business system that includes integrated support for manufacturing, distribution and financial management. The Unix module include accounts

payable and receivable, actual cost system and project cost control.

Prices begin at \$150,000.

► *Cincom Systems*
(513) 662-3300

Hardware

Computer Power, Inc. has introduced ComputerPower Mark II, an uninterrupted power supply for line conditioning and voltage regulation.

According to the High Bridge, N.J., company, ComputerPower comes fully equipped with galvanic isolation, which provides a physical shield against lightning strikes and isolation from power line noise. The product was designed for industrial and institutional applications.

ComputerPower Mark II capacities range from 900VA to 19kVA.

Prices begin at \$1,800.

PowerPC developers get kit from Apple

By James Daly

Software developers itching to build Macintosh applications for the upcoming PowerPC platform are getting a leg up from Apple Computer, Inc.

A small number of software development kits designed specifically for crafting applications on the upcoming line of RISC-based Macintoshes have been needed in development shops running prototype PowerPC machines, according to sources within Apple.

A beta version of the Macintosh on RISC Software Development Kit is available from APDA, Apple's source for development tools. Apple says it expects to issue at least two updates between now and when the first PowerPC Macintosh is introduced. Updates will then be released approximately every quarter, sources said.

In January, Apple is expected to announce several models based on the PowerPC 601 chip, which is a collaborative effort by Apple, IBM and Motorola, Inc. Several models employing the new chip are expected to ship by March.

The APDA development kit consists of tools for Apple's Macintosh Programmers Workshop environment as well as a PowerC++-rendezvous assembler, a C++ compiler and a debugger. The kit also includes a MacApp application framework designed for PowerPC Macintoshes.

Apple is still scrambling to get developers to craft native applications for the platform, which represents the company's future in hardware. Ten weeks before the expected unveiling

Object-oriented applications

Objects spell service for AAA

By Melinda Carol Ballou

American
Automobile
Association
Matthew, Fla.

Goal: To coordinate and continue access to AAA's travel data for geographically dispersed AAA clubs.

Method: To re-engineer existing TravelMatch software using Lucid's object-oriented development tools, XTV Software's multipurpose tools and Informix's relational database management system to create an object-oriented application running on Sun workstations.

Benefits: Faster access to updated travel information for AAA clubs and easier maintenance.

It ain't just for flats and dead batteries.

The American Automobile Association (AAA) is often thought of as a provider of emergency services, but AAA officials said many more people know their lobbying group as one of the largest travel agencies and sources of travel information. The organization is now trying to make travel data more accessible for 137 local AAA clubs across North America.

AAA's travel service application, TravelMatch, previously ran on AT&T's 382 minicomputers hooked up to dumb terminals. Over the past two years, the Travel Delivery Systems staff at AAA's main office in Heathrow, Fla., has been re-engineering the software to create an object-oriented application for Sun Microsystems, Inc., workstations. They have been using Lucid, Inc.'s object-oriented Energy tools, XTV Software, Inc.'s graphical user interface (GUI) painter tool and portability library and an Informix Corp. relational database management system.

While the new TravelMatch will initially run on Sun workstations and PCs attached to Sun file servers,

this is the first step in a move toward client/server, according to Armando Ramirez, senior systems analyst at AAA. However, plans for that transition are not yet finalized.

In two initial offerings, the clubs will be able to purchase their own Sun server to run the application locally or use the Florida office as a TravelMatch service bureau and connect to the Sun servers over a frame-relay network, he said.

"This will save the clubs the cost of having to purchase a big box," Ramirez said.

In addition to providing easier access for the clubs, the re-engineering effort seeks to make

Introducing

The greatest advance in COBOL programming since the Post-It® note!

COBOL Source Analyst (CSA) is a new, fully interactive productivity tool that allows you to quickly analyze complex COBOL source code directly from SPP/PC. With CSA you can follow your logic paths on the screen, without using Post-It notes, paperclips or all 10 fingers! And, all within SPP/PC!

CSA is an optional extension of SPP/PC v. 3.0 that provides powerful new capabilities, such as:

- **Navigation**—allows rapid examination of the branching logic of a program;
- **Outline**—provides hierarchical views of the program structure that can be expanded, collapsed and printed;
- **Analyze**—displays verbs and logic paths to see how a program is organized;
- **Syntax Checking**—highlights common syntax errors – before compiling!

CSA supports COBOL II®, OS/VS®, Micro Focus®, CA-Realia®, ANSI-74 and ANSI-85.

And, for a limited time, you can get CSA for just \$149, saving you over 60% off the list of \$395!
Call 800-336-5320 and order today!

CTC 1040 Marina Village Parkway
Alameda, CA 94501-1041

Application Development

AAA

CONTINUED FROM PAGE 73

the application easier to maintain and enhance since the object-oriented structure is more modular, Ramirez said.

"Because [the application] is object-oriented, it is easier to break the systems apart if we want to provide subsets, and it's easier to add new sections to it," he said.

For instance, Ramirez's group was able to add bridge and ferry information to the new version of TravelMatch. A primary purpose of the software is to provide access to information that would normally be in tour books and can quickly become outdated. It is important to be able to easily incorporate changes as the information shifts, Ramirez said.

Trivia for travelers

"We include data that's important to people but not widely known, such as when the state fair happens in a small town, the local calendar of events, where bridges and ferries cross or when leaves turn color in Vermont," he said.

Making the shift to an object-

oriented environment was facilitated by Lucid's Energize development tools, which offer a C++ compiler, good browsing capabilities and an underlying object-oriented database for incremental compiling and linking XVT. Software's tools made it easier to create the user interface because they allowed Ramirez's group to do both character mode and GUI mode. "It's the same source code; you don't have to change it," Ramirez said.

Several members of the development group had previous training in object-oriented development, which Ramirez said was helpful since they were able to act as mentors. An extra week of training for the development staff along with a presentation to upper management helped create the appropriate culture to support the move to an object-oriented environment.

TravelMatch also includes an electronic booking system for hotel reservations. This and the entire system are likely to move to client/server with Unix servers for PC LAN clients in order to provide greater interoperability within the various TravelMatch applications (see chart page 73) and to allow clients to communicate with one another.

other, Ramirez said. End users of the application at AAA headquarters spoke about the advantages of the new system vs. the old one.

Easy access

"The redesigned TravelMatch now is a menu-driven application which allows you to access information quickly without using function keys. You can make calls to agents so that you can call yourself through the application even without formal training," said Candace Christian, training technologist at AAA.

An expanded accommodations search lookup allows end users to do combined searches to determine customer lodging needs such as whether pets are allowed, whether the pool is handicapped-accessible or which Diamond rating a hotel has, she added.

She said beta users of the application are receptive to the pull-down menus and the additional information that was only available before in printed form. AAA travel agents can also order TripTiks, or customized maps for specific destinations, on the new system. The system then prints a work ticket with a pick-up label, and travel counselors assemble TripTiks.

Apple pushes PowerPC

CONTINUED FROM PAGE 73

of the PowerPC-based Macintosh, less than two dozen vendors have committed to providing native applications.

Apple spokeswoman Betty Taylor said many of today's Macintosh applications should run without modifying PowerPC. She said the real advantage of the technology will be with applications that exploit the RISC performance. Older applications employing emulation code could run at half the speed of those running native PowerPC code, Taylor said.

Analysts said that number should increase, especially with the APLDA development kit. "It's starting to get very busy," said Steven Ekenazi, an analyst at Alex. Brown & Sons. Inc. in New York. "Most hard-core development work gets done in the few months before a product comes out."

Working those applications

Third-party developers are also working hard to bring existing applications over to the new platform. At WordPerfect Corp., engineers are using Echo Logic's Flashport porting tool to port WordPerfect's Assembly code over to C, according to spokesman Dave Teran. Other companies, such as Microsoft Corp., are using their own porting tools.

Product manager Don Pickens said Microsoft plans to bring its complete Macintosh applications suite over to the PowerPC, with the rollout of native applications of Word and Excel by the first half of the year.

Apple is also optimizing parts of System 7 to improve performance on the PowerPC processors. Macintosh programs spend a lot of time calling procedures from the Toolbox. Apple has modified the Toolbox procedures that consume the most computation power to take advantage of RISC.

Windows of choice

Click... drag...
drag... click...
click... drag...
double-click...
click... drag...
PRESTO!!!

These days, this is all you need to do to write a Windows application. Once a test of programming expertise, Windows development is now so easy that almost anyone can do it. Of course, sophisticated projects do require some programming, but basic Windows development is no longer the task it was.

Choosing Windows as a development environment doesn't guarantee a good interface, however. Windows applications can be just as awkward, counterintuitive and ill-conceived as the worst DOS programs. Whether you are using Powersoft's PowerBuilder or SQL Windows in a client/server environment or

Microsoft's Access or Visual Basic in a standard environment, you should keep the following guidelines in mind:

► **Choose controls based on the type of data to be displayed.** Vertical controls such as up/down arrows or vertical scroll bars are well suited for skipping through records, while horizontal controls are better suited for scrolling through additional detail for the same record. Most users "see" data in terms of a spreadsheet — rows contain records, columns contain fields.

Combo boxes should be provided so users can make a selection from a predefined list of values.

List boxes should be used to display many values related to the current record.

If selection of choices for a specific attribute follows a consistent pattern of numbering or lettering, spin controls should be used rather than combo boxes.

Check boxes are best suited for yes/no situations. Radio buttons should be used when a user has a finite number of choices to make for a finite attribute. An example would be a college administration system offering the choices "freshman," "sophomore" and so on.

► **Use aesthetics to communicate information about the data.** Using different background colors is a good way to differentiate changeable from non-changeable data. Three-dimensional ef-

fects can help distinguish fields, labels and titles. For example, data fields can be displayed as sunken, labels as normal and titles as raised. 3-D icons have the advantage of making an application appear more "real" and informative.

► **If the application performs lengthy tasks that lock the keyboard, provide users with progress feedback.** For operations that are logically finite, such as copying files, a progress indicator such as a "thermometer" is a good way to accurately show the operation's progress.

For open-ended operations, such as processing a text file with an unknown number of records, a Macintosh-style clock with hands that move is a better choice. Never use both.

► **Avoid information overload and layered frustration.** Users want everything, and often programmers are only too happy to oblige with very informative and very cluttered screens. Information should be grouped into sets, based on how users actually work with the data. Related information should be a mouse click away, usually in a dialog box accessed by a button.

Think long and hard before adding functionality more than two levels deep. (The classic example of what not to do is the power setup dialog in Excel 4.0.) Excessive layering makes users angry. You can never have too many paths to a function.

► **Reduce, rather than enhance, users' dependence on pull-down menus.** Although a great advance over the cryptic "dot prompt" command sets common in character-based applications, pull-down menus have their own problems. They layer functionality, increasing complexity and ultimately frustrating users.

Developers should provide pull-down menus only as a last-resort method for users to access functions.

► **Code all possible ways of selecting data.** For example, when users need to select information from a list, they should be able to do the following:

- Click on the item, then press Enter.
- Double-click on the item.
- Click on the item and then click "OK."

Or, if the operation can be executed in batch, the user should be able to select several choices at once, using Shift and the arrow keys for contiguous choices or Ctrl and mouse clicks for noncontiguous ones.

There are lots of mature, high-level development environments available for Windows, which means you should be able to spend less time getting programs to work and more time advancing the usability of your applications. Take advantage.

Bernard is a technology management consultant at Omnicore Consulting in Philadelphia.

Application Development

PC/Icon: English-speaking tool

Natural Language tool lets users speak English

By Mellinda-Carol Ballou

a For developers seeking to allow users to query databases in native English, Natural Language, Inc., in Berkeley, Calif., last month introduced a Windows version of the company's Natural Language database query and development tools.

The Natural Language tools were available on Unix, but the development of natural language applications with that version was time-consuming, company officials and users said. PC/Icon, the new graphical Windows product, facilitates the process, they said.

PC/Icon lets developers build, test and debug natural language applications by creating the semantics and structure of a specific database. Developers are aided by four main windows that let them describe key business entities and relationships in English. PC/Icon can manage and track development of applications using a visual "global view" feature, and help and reference information is integrated into the tool.

End users type in an English query; PC/Icon parses the English query and

performs a syntactic analysis to determine what is being asked. The product then generates the appropriate SQL statements.

"We're a long-distance telephone company we're using [a Natural Language application] to detect fraud on our network," said David Lain-

der, telecommunications development analyst at Williams Cos., the telecommunications subsidiary of the Williams Cos. in Tulsa, Okla. "We also get performance data from our switches and provide that to our traffic engineering group so we can look at how the switches are performing."

User-friendliness and user-acceptance are key for the Wilton application, which is used by fraud detection analysts and traffic engineers. "It is an absolute that they don't know how in any shape, form or fashion to speak SQL," Lainder said. "They don't know anything about the database."

Another user said the Windows interface is fairly straightforward and that nontechnical developers can create ap-

plications, through "the more they know about their business, the better."

SML Inc., a medical data services company in Port Jefferson, N.Y., used Natural Language's tools to create an automated data-collection scheme that incorporates information from 12 hospitals, according to John Napoli, a partner in the company. The SML application allows hospital users to perform complex English queries across a range of data.

"It's like Lt. Columbo — you may know what the first five questions are, but based on those answers, you need to drill down further, and it's impossible to anticipate what those follow-up questions are going to be," Napoli said.

The new Windows release is less expensive, offers more deployment options and allows users to integrate data with other Windows desktop applications, such as spreadsheets or word processors, Napoli said.

Industry analysts said the lack of success of other natural language tools, such as one from Intelligent Business Systems, has to do with price and difficulty in creating applications.

Some other analysts said they feel Natural Language now stands a chance to successfully target the market with

lower-priced Windows tools.

"There's a limit to the complexity of what you can put into a point-and-click interface, and natural language interfaces are more suitable when users want to ask more complex types of questions," said Coe White, president of Database Associates International, a Morgan Hill, Calif., consulting firm.

Information problem

But while PC/Icon hides the complexity of the database, developers must insert the business knowledge and vocabulary into the Natural Language application for it to be useful.

"The problem with [Natural Language] is that they haven't built up a good methodology for capturing information in a methodical way," said Rich Fleckenstein, president of Performance Computing, Inc., a Chicago consulting firm.

Natural Language officials said the new Windows release offers a tutorial and methodology for incorporating the business information that will go on-line in the next release of the product.

PC/Icon is shipping now and is priced at \$2,500 for a developer's version and \$395 for a runtime license. PC/Icon allows developers to deploy applications on single Windows client platforms and to access database servers on Novell, Inc.'s NetWare, IBM's OS/2 and Microsoft Corp.'s Windows NT.

Brace yourself for the kind of speed and performance that makes other servers look like they're standing still. The newest PS/2 Servers do more than run. They fly.

The new Server 95 Array models are the fastest available. With their bottleneck-eliminating

SynchroStream™ controller, IBM PS/2 Servers can exploit the full power of their Pentium™ 66 MHz or 60 MHz chips and 256KB of L2 cache. And we can prove it: in complex workloads using popular workgroup applications, the PS/2 Server 95 Array beat a similarly equipped Compaq SystemPro XL by a

Application Development

Lient Software Corp. has introduced C++/Views 3.0, an object-oriented development tool.

According to the Framingham, Mass., company, the product speeds up and simplifies the creation and porting of graphical user interface (GUI) applications among Windows, OS/2 Presentation Manager, the Open Software Foundation's OSF/Motif, Macintosh and DOS character-mode environments.

The product includes more than 100 ready-to-use classes with programmer productivity tools. The library contains data, event, interface, printer and extended GUI classes.

C++/Views 3.0 prices range from \$499 to \$1,999.

► **Lient Software**

Cadre Technologies, Inc. has introduced Ensemble Viewer, an interactive two- and three-dimensional graphical tool for visualizing C programs.

According to the Providence, R.I., company, the tool provides highly interactive views of key program aspects by displaying program information and test results stored in the Ensemble database.

Ensemble Viewer offers browsing ca-

pabilities for program flow, data structure and physical file structure program aspects.

Users can interact with the software design code and files by looking at a graphical representation of the actual program structure.

Ensemble Viewer will be available for Sun Microsystems, Inc.'s SPARCstations next month and for Hewlett-Packard Co.'s HP 9000 and IBM's RS/6000 in February.

Ensemble Viewer prices start at \$2,400.

► **Cadre Technologies**
(401) 351-5960

Software Maintenance & Development Systems, Inc. has announced Aide-de-Camp Version 9.0.

Aide-de-Camp is a software configuration-management system for Unix and Digital Equipment Corp.'s VAX/VMS platforms.

According to the Concord, Mass., company, this version offers an improved command language and supports an optional DOS client, allowing PC users to work with the Aide-de-Camp system over a network or a Unix server.

Temporary data can be stored in memory, and Version 9.0 will support existing customer macros through a "Version 8.0 compatibility mode."

Aide-de-Camp Version 9.0 costs \$3,500

for a single user.

► **Software Maintenance & Development Systems**
(609) 369-7398

Ernest & Young has introduced Navigator System Series 2.1, an application development environment.

According to the Irving, Texas, company, the product consists of five major components: handbooks offering methods, techniques, tool guidelines and project-management techniques; an expanded monograph series providing additional information on core themes of the methodology; the Automated Methods Environment; education, including interactive videotape training and videos; and implementation services and support for adopting Navigator Systems Series.

HyperProject, a tool for customizing the methodology for specific projects, is also included.

A basic license costs \$65,000.

► **Ernest & Young**

(214) 444-2100

Hitachi Software Engineering America, Ltd. has introduced PenAnalysis Data Modeling, pen computer-based business process re-engineering tools.

According to the San Bruno, Calif., firm, PenAnalysis Process Modeling is used for developing entity-relationship models during the business area analysis

phase of enterprise re-engineering.

Users can collect and model business information and for further analysis, upload the data models into computer-aided software engineering systems.

Prices range from \$645 to \$24,405.

► **Hitachi Software Engineering America**
(415) 876-9600

The Alaris CARE Division has announced Object CM, an object-oriented configuration-management system designed to improve management of software development processes and increase programmer productivity.

According to the San Diego company, the product integrates an object base that is compliant with the Portable Common Test Environment (PCTE) and provides a configuration-management system that includes a PCTE-based object-oriented repository, an object browser, a graphical user interface, a system administration facility, and an assortment of personal productivity tools. Object CM can be extended to support process control over activities, including coding, documentation, software design, project management and software reuse.

Through year's end the introductory price for a five-user license is \$9,995.

Management

The cyberpunk movement is influencing art, music, literature and even supercomputer design. Are cyberpunks creative visionaries or merely

nerds with an attitude?

written by candee williams

hen employees in the information systems department start coming to work with a copy of *Wired* or *Mondo 2000* under one arm and begin showing "cyberpunk" traits, should you quickly change your computer passwords, or do you invite the employee to lunch?

The cyberpunk movement is changing as fast as technology itself, and today's cyberpunk is as hard to pin down as, well, cyberpunk. But IS managers may want to keep a close eye on those cyberpunks working in their midst: They may provide a valuable

Cyberpunks, page 80

Some argue that real-life cyberpunks are technology prophets, recognizing the mass-media opportunities of tomorrow, today

CONTINUED FROM PAGE 78

able window to tomorrow's IS frontiers.

Or, they may be someone with a hackerlike attitude you should be very worried about.

Or, then again, they may be no more valuable or threatening than anyone else in the IS department.

The answer depends on who you talk to.

Tainted image?

Cyberpunk often conjures up images of social misfits dressed all in black with far-away stares, spiked or long hair and electronic gadgets hanging from their belts. Not only is that image "hopelessly outdated," say sources close to the movement, but it betrays what may be the value of these technovisionaries to the IS manager.

A positive view of cyberpunks is held by Paul Saffo, a research fellow at the Institute for the Future in Menlo Park, Calif. Saffo is a recognized expert on the cyberpunk movement and has written extensively about it. He says IS managers should credit the cyberpunks in their departments as being among their most creative employees and the ones who recognize where technology is heading.

"IS managers are going to have a hell of a time keeping up with the changes in technology," Saffo says. "They had better find out what's going on because the cyber crowd is going in and latch on. The impact is likely to be significant, and it can be summed up by the term 'reinvention'—of new ways to do old things or new applications of existing technologies."

Up to no good

Holding a negative view is David Vaskevitch, director of enterprise computing at Microsoft Corp. "It's the same culture that 15 years ago was buying the blue boxes for free phone calling. It's a large, anti-establishment, subculture made up of mostly hackers."

A third view is reflected by Justin Rathner, director of technology at Intel Corp., who sees the movement in a mixed light. He says cyberpunks may be focusing "on some pioneering practices" for information sharing, but he has doubts about how much the movement will affect IS staff.

"I don't think they'll have any more impact on mainstream information systems than the Nintendo kids," Rathner says. "In fact, the Nintendo users will have had more impact."

cyberpunk \si-ber-'pungk\ (n) 1: a late 20th century techno-revolutionary or someone who poses as such; 2: a hard-boiled hacker with anarchist inclinations; 3: a computer geek who likes Ministry; 4: as seen in Time magazine, a member of a countercultural "movement" of the same name, characterized by a combination of technological savvy and a rebellious lifestyle; 5: Billy Idol's comeback album; 6: someone who has delusions about living in the future; 7: someone who maintains that mirror-shade sunglasses (last seen on CHiPs) never went out of fashion.

Sources: Mondo 2000, Issue No. 10

The movement, did, however, influence the design of Intel's newest supercomputer, according to Michael Barry, vice president of analysis at GVO, Inc., a Palo Alto, Calif., product design firm. The computer, called Touchstone Delta, is enclosed in a wall of light-emitting diodes. When the machine is running a program, lights blink on and off, representing communication between the computer's "nodes."

"It is like a dance of light, a ballet," Barry said.

To help design the product, Barry and his marketing team studied cyberpunk culture, science fiction novels and movies such as 2001 and Star Trek. It also visited a lot of computer centers to talk to programmers.

"We were seeing a lot of Mondo 2000 T-shirts," he said. "The cyberpunk subculture is heavily in those centers, and the people are involved."

The movement was spawned by William Gibson's darkly futuristic novel, *Neuromancer*. Gibson coined the term "cyberspace," which he describes as a "consensual hallucination... a graphic representation of data abstracted from the banks of every computer" in his novels, computer jockeys actually enter cyberspace and move around in the network.

Since its beginnings just a few years ago in the San Francisco Bay area, the cyberpunk movement has explored many technological frontiers. Born in the underground, cyberpunk has also been "surrendering" to the mainstream, and the 100 or so original "hard-core" cyberpunks have now been replaced by legions of computer-literate people in the establishment.

While the movement tows with such topics as virtual sex and smart drugs that enhance intelligence and creativity, it has helped

standby benign view.

Queen Mu, *Mondo 2000's* self-proclaimed "domineatrix," who sometimes goes by the name of Alison Kennedy, describes cyberpunks as "digital dandies who are enchanted with technology and its possibilities."

Double identities

Many of the most avid cyberpunks are highly successful IS employees by day and techgroups by night, according to Queen Mu. Some are IS managers themselves. Others are free-lance computer consultants, holed up in their apartments overlooking Silicon Valley perhaps, communicating with the outside world by modem and electronic bulletin boards such as The Well.

Wes Thomas, the "futurist" for *Mondo 2000*, says the cyberpunk in any IS organization may be the one most in tune to the new techniques that the company should be taking. "There's always an in-house visionary."

So, should IS managers remain calm if they see employees carrying the latest issue of *Wired* or wearing a *Mondo 2000* T-shirt? Or if they hear the word "cyberpunk" bandied about the office, does it mean their computer programmers are learning how to break security codes or "borrow" a little free telephone time?

The answers are most likely yes and no, respectively.

Familiarity with the cyberpunk subculture probably means an employee is highly computer-literate and open-minded and spends a lot of time thinking about how tomorrow's technology can shape today, according to Richard Wonder, vice president of IS at Robert Half International, Inc., a Menlo Park, Calif.-based recruiting firm. (Wonder is not involved in IS recruiting.)

Wonder acknowledges, however, that the absence of corporate resources, particularly if a company is linked to the Internet, is probably taking place. Rather than taking a coffee break or talking to a friend down the hall, a cyberpunk employee might take 10 minutes to send an electronic-mail message across the country or browse through an on-line news service.

But *Mondo 2000's* Thomas draws a sharp distinction between hackers, who "manipulate computer and telecom technology for the sheer joy of mastering it," and crackers, who are "criminals who engineer network pranks or steal or tamper with data."

advance serious topics to the mainstream, such as virtual reality and wireless technology.

Cyberpunk is also having a real impact on aspects of the visual arts, music and technology. Hollywood has already borrowed from cyberpunk for several successful science fiction thrillers.

Saffo says the benefit of the cyberpunk movement is the creative way it looks at where technology has been and how it can be applied for new uses. These are "people with crazy ideas, and not a lot of adult supervision, who seize the technologies available and create something new of it," Saffo says.

Vaskevitch sees true cyberpunks as computer cowboys roaming the Internet in search of the next IS frontier. They live by their own rules in a world where the PC is everybody's "equalizer."

Editors of magazines that cater to cyberpunks take an under-

Others see them as a threat to information privacy who delight in "hacking" information systems for selfish gain or even destruction

Many cyberpunk novel heroes are crackers, but few real-life cyberpunk wanna-be cross that line, Thomas insists.

And Thomas says the cyberpunk offshoot, cypherpunk, has positive political and social agendas.

"The cypherpunk movement consists of encryption programmers and activists who are fighting to preserve electronic privacy on the nets through the creation

and distribution of secure personal encryption standards. The cyberpunks are transforming the spirit of the original cyberpunks into practical and political action," he says.

Rathman feels the imminent interactive TV revolution will quickly offer up anything cyberpunks can dream of in the way of high-tech multimedia communications. And with that, cyberpunk may find itself unable to keep pace.

But that view isn't shared by Alekia Rosen, a partner in Ponic Public Access Internet, a New York-based company that provides access to the Internet to individuals and corporations. "The same ideals that drove cyberpunk — to make information more available and omnipresent; the goal of connecting everything to everything else — are the same things that drive the Internet."

No so long ago, the Internet, which

links about 2 million computers throughout the world, via phone lines, to data banks and E-mail systems, would have seemed like science fiction. Cyberpunk, for all its flaws, encourages people to think about technology and push the limits of current use. And that's the stuff new realities are made of.

Client/server projects go on but team-programming from Gupta.

Client/server computing promises flexible, responsive business systems, but delivering can be an endless chore. Too big for one person, client/server projects require multiple developers, end-users and managers to work as a team. Only Gupta SQLWindows™ mentors a productive, graphical PC development environment to comprehensive group programming facilities.

We make your group a team.

SQLWindows provides version control, check-in/check-out and project management to unify the efforts of programmers. End-users can help prototype screens, forms and reports through our easy QuestWindow™. And our open, repository-based system can exchange data with many CASE tools, streamlining management of even the biggest client/server applications.

Cut any client/server project down to size.

The team facilities of SQLWindows are matched by a rich, object-oriented, graphical development environment and comprehensive database connectivity. Put your endless client/server projects on a schedule with the team productivity and sheer power of SQLWindows. Call 1-800-878-3887 ext. 206 for your free demo disk today.

thanks³

AT&T Data Communications Services thanks the readers of *Network World*, *Data Communications* and *Computerworld* magazines for once again ranking us #1.

No question about it... awards mean even more when the judges are a tough bunch of data network customers. Customers whose needs are our #1 priority.

First, the readers of *Computerworld* ranked AT&T #1 in their Brand Preference Survey for data services. Then, *Network*

World readers gave us their coveted Enterprise Technology Award. To top it off, AT&T received top marks for reliability and top marks overall in *Data Communications* Users' Survey.

Why all the kudos? Because at AT&T, we work hard to design solutions to meet our customers' needs—with reliable, award-winning products and services. Including ACCUNET® Data

Services and InterSpan® Data Communications Services.

As far as we're concerned, we're not #1—our customers are. For more information, call 1 800 248-3632.

AT&T The Best in the Business™

Power has its price.

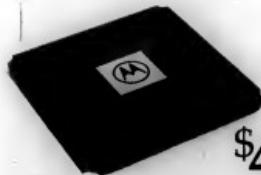

That price is low, as in personal computers priced under \$2500 that are faster than any PC on the market today. You see, PowerPC™ Microprocessors from Motorola not only deliver significantly more power than the Pentium® Microprocessor, they deliver it at a fraction of the cost.

	Intel® Pentium®	Motorola® PowerPC™
Transistors (millions)	40	10
Die size (mm ²)	64.5	120
Speed (MHz)	200	100
Power (watts)	10W	8W
Die size (mm ²)	262.5 (250MHz)	330

The reasons are quite simple. Through Motorola's superior design and manufacturing technology, we've packed more power into fewer transistors. We deliver that power on a chip that's less than half the size (120 square millimeters vs 262 square millimeters).

*These comparisons are based on the recommended retail price for a 1,000-piece quantity of the 64MHz® Pentium and the recommended price of the 100MHz® MPC601 for the same quantity. Prices are subject to change. Speed comparisons are based on gross ratings of performance of the 64MHz version of the MPC601 versus the 64MHz version of the Pentium as announced by Intel, and Motorola's estimated projected performance of the 64MHz version of the MPC601. Thermal comparison is based on preliminary heat specification for the 64MHz Pentium, and the performance of samples of the 64MHz version of the MPC601.

\$450

\$965

Essentially, that means we can manufacture over twice as many microprocessors in the same time and space as Intel® can.

To take a closer look at the low cost of power, call Motorola today at 1-800-845-MOTO. We'll be happy to provide you with more information, including our free PowerPC Information Pack.

PowerPC Microprocessors from Motorola. For those who make computers, they offer the opportunity to build high-performance, low-cost computers profitably. For those who buy computers, they will cost you a lot less to be powerful.

PowerPC Microprocessors. Changing the course of computing. For the better.

COMING SOON! LAS VEGAS CONVENTION CENTER, 2-6 MAY 1994.

THE BEST AND THE BRIGHTEST. ALL UNDER ONE ROOF.

Introducing NetWorld+Interop '94—
the most important networking and
computing event on earth.

It's the show that had to happen. NetWorld+Interop '94 was created specifically to mirror the changes in networking itself—the convergence of LAN, WAN and telecommunications in today's "information everywhere" business environment.

How do you satisfy user needs when products and technologies are constantly

changing? How do you make buying decisions that stand the test of time? Seeing all your alternatives working in one place at one time is the only real way to find out.

Imagine, more than 600 of the world's leading networking and computing suppliers all under one roof. Demonstrating the latest technologies. Letting you test drive products and see them work together on the InterNet, a live multi-vendor, multi-protocol network that connects all vendors.

What's more, industry gurus

will tell you about what's here now and what to expect. And university-level conferences and tutorials provide a chance to learn and exchange ideas with the industry's best and brightest.

And now, for the first time, NetWorld+Interop '94 will be held in five international business centers—Las Vegas, Berlin, Tokyo, Atlanta and Paris. No matter which one you attend, you'll see first hand how the world's most innovative products and technologies can give you a competitive edge.

All brought to you by

Interop Company, the industry's premier producer of networking and computing events and exhibitions.

For information about attending or exhibiting at this unparalleled networking event, call 1-800-488-2883. Outside the U.S., call 415-941-3399, or contact us over the Internet at network@interop.com.

Better than NetWorld.
Better than Interop. It's one event you can't afford to miss.

NetWorld+Interop '94
is produced by
Interop Company.

In Depth

Putting LAN and WAN traffic on a single backbone can decrease the cost of supporting multiple networks. But United Parcel Service and The Medical Center of Delaware are finding bumps on the road to internetworking, including iffy net management.

MAN INTERNETWORK MAN

■ STAN FIEDOR AND BOB DAVIS at The Medical Center of Delaware have fought broadcast storms and agonized over net management for their internetwork

Companies that maintain separate SNA and LAN internetworks are getting sick of the high costs of supporting these networks individually. A survey by Forrester Research, Inc., puts the typical yearly support cost for a 5,000-user LAN internetwork at \$5.4 million and at about \$2 million for an SNA network.

To curb such expenses, companies are moving to consolidate and integrate wide-area network and LAN traffic on a common network backbone. Easier said than done. Issues such as SNA session response time, network integrity and reliability, SNA and LAN interoperability and network management come into play.

On the following pages you'll find the stories of two organizations — United Parcel Service, Inc. and The Medical Center of Delaware — that are slogging through internetwork projects. The medical center chose to build its backbone from scratch and bridge its multiprotocol traffic, while UPS is migrating to a router-based setup and awaiting IBM's Advanced Peer-to-Peer Networking with high-performance routing.

What's more, we've asked communications industry consultant David Axner to walk through the projects with us and offer strategic and technical takes on what the companies are doing.

Interviews with The Medical Center of Delaware and UPS were conducted by free-lance writer Joanne Cummings. David Axner, who provides the consulting advice to this piece, is president of Data Associates, a LAN internetworking and security consulting company in Oradell, N.J.

THE HESITANT TRAILBLAZER

UNITED PARCEL SERVICE

Laying the groundwork for a souped-up APPN

STRATEGY: UPS had been using X.25-based Token Ring LAN bridges and software gateways providing X270 emulation when the majority of wide-area traffic was host-to-host. To enable LAN-to-LAN communications and to support distributed applications, the firm plans to move to Advanced Peer-to-Peer Networking routing based on IBM's OS/2 network processors by year-end 1994.

UPS knows that IBM's forthcoming APPN is a solution tailor-made for its heavily IBM internetwork. It's figuring out how to get there that keeps the information systems staff up at night.

A lot of companies are cautious about how they migrate to a router-based APPN setup, says Tom Ferro, project manager at the Mahwah, N.J., package-delivery giant. But not UPS. "Right now, because of business needs, we have to move ahead," he says.

To move away from its SNA and LAN bridging architecture, that option, which took advantage of UPS' private X.25 packet network, UPS was designed to enable the company's increasing number of LAN users to communicate with IBM hosts in two data centers.

For that environment, the logical choice seemed to be LAN software gateways that provided 3270 emulation and linked up to the host via Token Ring X.25 bridges. After all, LAN traffic was primarily local; LAN-to-LAN traffic was virtually nonexistent, and the bulk of LAN-to-host traffic occurred in batch mode at night.

But about 18 months ago, UPS began deploying more LAN-based applications, which increased LAN-to-LAN and distributed application traffic.

The company has 13 regions in North America, which are divided into approximately 90 districts, explains John Bruno, telecommunications analyst at the Mahwah site. "By pushing a lot of applications down to our lowest level — the districts — we can reduce costs and share services. That's a significant cost benefit."

Placing more applications at the LAN level lets the company consolidate several functions, such as communications, routing and file and print services on the server, which makes them easier to manage.

The file servers also support the company's distributed database applications, including critical ones that track automotive parts and the status of UPS trucks and vans. Data moves throughout 100 buildings and between the host and offices. Bruno says consolidating data on file servers makes it easier to manage across the network.

At first, UPS looked at scaling up the bridged architecture to accommodate the new traffic. But that plan proved unworkable. "We went to routing because we needed a solution that was scalable," Ferro says. "Sheet numbers tell us we needed an intelligent device to manage our traffic."

"With bridging, we had problems with control," Bruno says. End users, for instance, had to have their own configuration capabilities on

COMMENT

...bridges do not provide a fire-wall between network segments to hold broadcast storms. As bridged networks scale up, there is more of a chance of storms because all bridges receiving broadcast frames replicate them and pass them on. Although routers introduce complexity to the network, they prevent broadcast storms because they provide greater operating flexibility. Routers enable dynamic routing over the best path and look for alternate or redundant routes to eliminate or reduce traffic congestion.

...any feature here is likely to be irrelevant, which generates implementation requirements and pushes up general costs. IPX, offering sequential SNA-like error recovery, is unlikely to be implemented over the next few years.

...any routers are available with priority, which enables the SBCS prioritization of SNA traffic. In addition, SBCS provides a mechanism for prioritizing SNA traffic over other protocols, such as TCP/IP, in the backbone. Increasing traffic and priority, my sounding suggestion.

Having applications on the server eliminates unnecessary network traffic and improves response times.

...changes do not affect a customer's solution because they are limited by hop count. They could be the number of bridges or LAN interfaces "hopping" over from one end to the other, but hop count does not change.

the bridges because Bruno's group could not scale them up to meet connectivity requirements.

"We wanted to give users something that would let them navigate through the network without having to worry about how to get to that next LAN," he says.

Bruno says the network also experienced broadcast storms and network loops, nasal problems encountered when users try to scale up to a very large bridged network.

The company has decided to go with a bridge/router hybrid network this year, deploying approximately 300 routers and integrating them with existing network bridges.

It hopes to move to a fully routed environment once APPN is available with high-performance routing (IBM says this will likely be next year).

In addition to avoiding problems inherent in large bridged networks, UPS hopes to gain cost advantages with routers because it will be able to deploy a host of new applications without incurring any new WAN costs.

Ferro is thinking that once UPS moves to routers, the percentage of SNA traffic will go down while the number of applications using other protocols (IPX, L12.2) not bound for the host will increase. "By taking the mileage down and pushing all those applications to where they need to be at a district level, we don't have to deploy more SBCS lines. It's cost avoidance," he says.

Why APPN?

UPS has locked on to APPN as a goal for several reasons. Its customer service network, which is based on 30 IBM AS/400 minicomputers, is currently meshed together using APPN, which enables the machines to communicate as peers. In addition, UPS uses Advanced Program-to-Program Communications (APPC)-type applications that could take advantage of the peer-to-peer capabilities of APPN.

Ferro says the company has OS/2 database servers that could natively run APPN and OS/2 PCs running APPC applications. "Add that to the AS/400 network and you have a lot of requirements for APPN out in the network."

In addition, APPN should cut down on some network overhead.

But there are still problems, including prioritization, Ferro says.

For example, because SNA sessions are limited to time out if they incur any delay across the network, multiprotocol backbone need to assign a higher priority to routing SNA, rather than LAN, traffic. Although it is easy to customize the network so SNA users receive this higher priority, it's more difficult to change priority according to the individual application.

"We'd like the application to know that the SNA user is running a batch job and so should automatically be throttled back," Bruno says.

He'd like to see the industry move faster toward Asynchronous Transfer Mode (ATM). Right now, no protocol is robust enough for UPS to standardize on.

The company has had to contend with running SNA, APPN, TCP/IP, IPX and Bayesian Systems, Inc. NetBROW. "I'd love to have ATM to the desktop... it would be ideal on steroids," Bruno says.

"We're blazing new trails," Ferro says. "We'd just like some input on whether we're doing it right."

Brackets do not provide a fire-wall between network segments to hold broadcast storms. As bridged networks scale up, there is more of a chance of storms because all bridges receiving broadcast frames replicate them and pass them on. Although routers introduce complexity to the network, they prevent broadcast storms because they provide greater operating flexibility. Routers enable dynamic routing over the best path and look for alternate or redundant routes to eliminate or reduce traffic congestion.

Having applications on the server eliminates unnecessary network traffic and improves response times.

Changes do not affect a customer's solution because they are limited by hop count. They could be the number of bridges or LAN interfaces "hopping" over from one end to the other, but hop count does not change.

THE MANAGEMENT DILEMMA

THE MEDICAL CENTER OF DELAWARE

Where, oh where, are the net management tools?

STRATEGY: Currently bridging multiprotocol traffic using encapsulation. Installing T3 links among three main sites — a data center and two hospitals. Moving from bridging to routing.

"Implementing a multiprotocol net is possible — we're doing it," says Stan Fiedor, manager of data communications at The Medical Center of Delaware in Wilmington, the largest health care provider in the state. "Managing it? That's another story."

In the past five years, the medical center has expanded its existing network of 50 PCs and about 225 IBM and Data General Corp. terminals linked to hosts via 5.6K bit/sec. lines to a robust multiprotocol backbone. The setup enables users in its two primary hospitals to simultaneously access applications residing on LAN servers, minicomputers or mainframes.

Rather than having to cope with modifying separate SNA and LAN backbones, the center built the new network to support diverse protocols such as SNA/Synchronous Data Link Control (SDLC), Novell, Inc.'s IPX, Xerox Corp.'s Xerox Network Systems (XNS) and TCP/IP.

Although the center was successful in implementing its universal workstation concept, managing the driver and gateway software was a monumental task. "One of the things we've slowly been working on and has been a challenge for us is managing those multiple protocols," says George Brenzke, director of computer services at the center.

In the end, the information systems group, led by information systems manager Bob Davis, built its own in-house resident software that checks each PC when it is booted to ensure it is configured properly. If it is, the PC is allowed to boot. If it isn't, the software wipes out the old or inappropriate software, loads the correct configurations and allows the PC to boot.

"If you don't have something like that," Fiedor says, "you're stuck with manual updating, which is resource-intensive. You can't get it from a vendor because I don't think most vendors understand the problem well enough."

The medical center supports SNA traffic over the network through encapsulation. For the 200 or so terminals on the network, the SDLC socket gets encapsulated within the XNS protocol for bridging the data center, where it is stripped out and passed to the CPU. The PC-based SNA traffic is encapsulated in IPX and stripped out at its destination.

According to Fiedor, neither method has caused any problems, and response time has been very good: 0.6 to 0.8 seconds.

The center has experienced broadcast storms typical of large bridged networks but tracked the problem to an automated session reconnect feature and modified it.

What IS found is that whenever there was a session problem, the auto-reconnect feature would constantly try to reconnect every second, resulting in a broadcast storm. Brenzke says IS modified the feature so users would get prompted to hit a key that would re-connect them. "It's more random that way,

rather than with the PCs, which tend to do it once a second."

The fact that the medical center has not experienced problems with prioritization and bulk file transfer likely has to do with its network configuration. The company decided to centralize its cluster controllers and gateways instead of following the traditional SNA approach, which consists of linking a front-end processor via low-speed lines to distributed remote cluster controllers. With controllers local to the mainframe, users get subsecond response time.

The firm used the same approach with its LAN gateways, which consist of a PC connected to a 16Mb bit/sec. Token Ring network at the data center and an Ethernet connected to the T1 backbone. The envelope connects SNA users to the IBM mainframe via a local cluster controller attached to the Token Ring. Here, also, LAN users get subsecond response times.

An added benefit is that equipment is easier to maintain because it is centrally located. For instance, the company is able to resolve hardware problems quickly by substituting on-line spares.

The next phase of the multiprotocol network implementation calls for replacing T1 lines with T3 lines between the two hospitals and the data center, as well as moving to a router-based architecture. One T3 link is already in place.

"We're looking at going to routing in order to make the T3s more efficient as far as what information goes across," Fiedor says. "We'll also use them as a firewall against broadcasts."

But even with the increased throughput from the T3/router scheme, the medical center is facing several challenges. True network management tools — as par with the system management tools found in the computer and mainframe environments — are just not there, Brenzke says. "Distributing network management is a challenge."

Fiedor agrees. "We need to manage everything from mainframes, with products like NetView; all the way down to managing the wiring infrastructure," he says. "We've gone as far as taking all our blueprints and putting them on a CAD system so we could manage our wiring a little bit better."

The center is planning to implement native management systems for each platform and tie them together with a "manager of managers." It has chosen Unisys/Bass, Inc.'s NetDirector.

This setup would enable IS to control all platforms from a single workstation. Fiedor says he would also like to eventually implement a rules-based system that would enable him to automate repetitive management processes, such as maintaining print queues and ensuring terminal availability.

Another challenge facing the medical center is that changes in health care practices have begun to put pressure on it to add more remote sites, such as doctors' offices, into the network.

The organization is looking at several options to do this, including Integrated Services Digital Network services and high-speed modems based on Vlasi technology.

"Our aim with the foundation we have is to be able to accommodate whatever comes down the pipe," Brenzke says.

COMMENT

By Michael J. Karp
Executive editor
of *Network Computing*

This strategy works well for the medical center; however, it was not able to come up with a common encapsulation method for the entire network because it uses two network protocols: XNS and IPX.

IS took about eight hours to install the T3 line. There was an interoperability problem among the attached devices, a common occurrence when installing T3 lines.

Protocol-dependent and port-based management are the best ways to do distributed management.

The interface between native management systems and UUCP's NetDirector is Simple Network Management Protocol (SNMP). End-device to concentrator has SNMP agent built into NetDirector, which monitors the operations and human resources. Protocol problems may surface if the agent's SNMP management information base (MIB) does not comply with standard SNMP.

SOFTWARE CONTRACTS

By Joe Asar and
Mark Demboski

Would you lease a \$20,000 car for \$20,000 down and a \$3,000-a-year maintenance fee if you were the only one allowed to drive it, look under the hood or read the owner's manual? If not, then why would you sign a vendor's standard form software license, which limits your rights in the same way?

Almost all software licenses contain provisions that, either on their own or in conjunction with copyright law or other court decisions, place undue risk on the licensee.

The following are examples of common provisions often left unchanged during software contract negotiations. In many cases, these provisions can be adjusted to benefit the licensee.

Choice of Law

When drawing up software licenses, watch out for contract wording that reduces your ability to defend yourself if the contracted relationship fails and the vendor threatens to sue.

The best leverage is to specify in the contract "choice of law" — the state whose laws you will abide by in case of litigation. Ideally, this should be your company's home state.

While most companies specify the choice of law, they do not establish the specific venue and jurisdiction, leaving the choice of location open to the action's initiator. For instance, if you specify California as the choice of law when the ven-

dor brings suit in New York but you neglect to choose the venue and jurisdiction, you could be required to have attorneys familiar with California law present for New York court appearances — a potentially expensive situation.

To prevent vendors from forcing you or your attorney to come to their court, add wording to the provision to the effect that "any action or proceeding brought by either party against the other arising from or related to the software license shall be brought in a court of competent jurisdiction located in your home state and over your local area." Both parties must also agree to recognize the jurisdiction of the specified court.

Warranties and Remedies

A breach-of-contract suit occurs when one party fails to perform its obligations. Generally, this does not occur when responsibilities and specific solutions for failure to perform are clearly defined. Therefore, it is up to you to ensure that no gray areas exist in the contract in terms of warranties and remedies.

For instance, a warranty could state that the "vendor warrants that the software, if installed as specified, will operate substantially in compliance with the specifications. Verified program errors will be corrected if they can be reproduced on the vendor's system, with customer data, or if so requested, the customer's software is to receive a refund for the software containing the error."

This warranty, however, poses prob-

lems if the "software containing the error" is not stand-alone. In fact, if the software is coupled with a modular software license where the additional modules are just as important to the system, the results can be costly.

As is, this provision potentially allows the vendor to fulfill its obligation by refunding the cost of, say, a \$10,000 add-on module, while the remaining \$200,000 piece of the system is unusable or provides limited benefit.

An adequate warranty is one that provides for a total refund at the customer's option and the ability to terminate the license if the vendor cannot make any part of the software comply with the specifications spelled out in the agreement.

Confidentiality

Many standard license agreements place total and absolute responsibility for software confidentiality on the licensee. Standard contract language may also restrict the software's use to company employees, which is generally unacceptable.

A revised confidentiality provision should state that contract personnel, consultants and other persons performing work for you or on your behalf will have access to the licensed software and materials.

You should also take steps to relieve the "absolute" nature of the clause to the effect that you will use your "best efforts" to protect the confidentiality of the licensed software and materials, as well as use your "best efforts" to prevent the creation of unauthorized copies. If you don't and the vendor learns there has been unauthorized access, it could seek breach of contract or, more likely, threaten to sue if you don't pay an additional fee.

Maintenance

Some vendors use a "required maintenance fee" clause that guarantees only that maintenance which "substantially

NO PROTECTION

complies with specifications." Unfortunately, vendors can technically get out of this responsibility by changing the specifications.

For instance, when the software does not perform according to the agreement, a vendor may change the documentation to reflect the difference and blame it on a documentation error rather than the software. More commonly, vendors may fail to provide maintenance that keeps the product in step with changes in operating systems and hardware.

Recognize the "maintenance required" provision for what it is: a revenue stream. Often, vendors that do not want to give up this guaranteed annual revenue stream allow customers to customize maintenance packages that will reward a company from using the software when maintenance fees are not paid.

An alternative is to agree on a length of time to pay for maintenance, with the understanding that afterward, your company can continue to use the software without a maintenance provision.

Asar is founder and president and Demboski is a senior consultant at International Computer Negotiations, Inc., a Winter Park, Fla.-based firm that assists companies in negotiating better deals and crafting better contracts.

Percent

COMMISSIONER IS POSED TO LAUNCH A-GAME SYSTEM CALLED THE CD32 TO COMPETE WITH NINTENDO AND ITS ULT. KENNEDY SAYS RESEARCH INDICATES IN ITS NEXT-GENERATION CD32 SYSTEM BUT SAME IN REACTION TO USUAL PROBLEMS. INVESTIGATORS PUSH PIRACY CLASS-ACTION LAWSUIT AFTER THE COMPANY ANNOUNCED ALLEGED FOR THE LAST QUARTER.

Relational risks, rewards

Though the valuations are sky-high for Sybase, Inc. (SYBS) and Oracle Corp. (ORCL), both stocks may have room to grow.

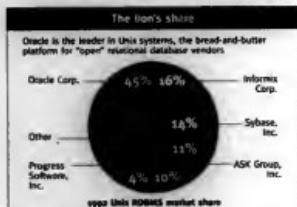

Salomon Brothers, Inc. analysts John Jones Jr and Thebaire Lie were impressed with Sybase's new Replication Server technology, which beefs up the product's ability to handle mission-critical applications. The Replication Server synchronizes multiple copies of distributed data, providing two key benefits: Users gain fast local access to the distributed data, and a level of fault tolerance is provided in case one server crashes. Sybase announced revenue growth of 67% for the most recent quarter and underwent a 2-for-1 stock split.

Jones and Liu also noted in a recent report that Oracle 7.0 is gaining momentum. Oracle is moving aggressively into reseller channels as well, which may put the squeeze on rival Informix Corp. (IPMG). But Informix reported healthy growth last quarter. Progress Software, Inc. (PRGS) is another relational database management system vendor that is offering products in the market.

Of course, with many database issues already at high levels, there is some downside risk.

"The database guys are rich, and there's the chance of a price cut," said Curt Monash, publisher of the "Monash Software Letter." Monash said the safest of these stocks is Oracle. "They have the most other businesses [outside of the RDBMS market], and they are positioned at the high end, which is the last place a price cut would hit," he said.

Computer Industry

Changing channels

Resellers eye outsourcing rescue

By Michael Fitzgerald

■ While the bulk of PC systems sold to corporate America still go through resellers at this point, that is no longer enough to ensure profitability. A beleaguered channel is therefore pushing as hard as it can to metamorphize into a different and more profitable role as an outsourcer.

However, it may face an uphill battle. Although the handful of nares who currently outsource through resellers seem pleased, others appear reluctant to give it a try. But when they do, it may signal the end of traditional, one-stop outsourcing. This latest attempt at re-packaging the channel is driven by the squeeze on reseller profitability today, from plummeting prices and margins to direct selling from vendors and product backlog.

Focusing down

Reseller executives do not see themselves directly challenging traditional outsourcing such as Electronic Data Systems Corp. or Andersen Consulting. Rather, the new "resources," as they might be called, would focus on the niche areas the global outsourcing companies are less likely to pursue — PC implementation, service or support, for example.

Outsourcers "can't afford to compete at the low end," said Ed Anderson, chief operating officer of Computech Systems, Inc., in Dallas. "[They're] playing the old outsourcing model, where it was 'Let us do everything for you.' We do things à la carte," said Alan Held, vice chairman and co-founder of MicroAge, Inc., a billion-dollar reseller chain in Phoenix.

It may take time for outsourcing to catch on, as evidenced by Computerland and its decade-long operation to MicroAge. (CW, Sept. 27). Computerland's efforts to join the PC outsourcing business strained its cash flow, sparking the sale.

Unfazed, reseller executives point to studies by consultancies such as Gartner Group, Inc. that

show that hardware and software purchase prices represent less than 20% of the actual cost of implementing a PC. Gartner estimated that maintenance, configuration time and other costs ratchet up to form the rest of an estimated \$40,000 cost per PC over a five-year period.

PC maintenance, configuration and help desk support, according to Vaughan Hovey, director of information processing services.

"We don't have to carry inventory; we have access to an [Enter] customer executive council, and the training and support they do is better than we could do," Hovey said. He also cited employee cost savings. Kodak originally transferred 50 employees from its PC group to an outsourcer. Enex has more than double that number at Kodak.

The Star Tribune Co. in Minneapolis saves direct costs on personnel by outsourcing labor-intensive tasks such as PC configuration and maintenance to local resellers, as well as training in generic software programs such as WordPerfect Corp.'s WordPerfect.

Robert Lewis, the Tribune's systems leader, said outsourcing has become more important as the Star Tribune has put essential op-

We care-all
Even if successful, resourcing may not be a panacea for the channel. Lee Levitt, an analyst at IDC, says that even with services

figured in, the traditional reseller channel will see revenue grow only from \$2.7 billion in 1993 to \$3 billion in 1997.

Move to changing diversity
Diversity recently led the Better Computer Dealers to adopt a new name, the Computing Technology Industry Association.

operations, such as elements of its classified advertising and its subscriber database, on a LAN. "We don't have the time to load software on PCs — it's not a good use of our ingenuity," he said.

Services to be had

Even Microsoft Corp. has outsourced some of its PC operations. Easier and Computerland split a list of value-added services within Microsoft, including technical service, repairs and PC deployment.

"We can handle a much higher volume of PCs with a much lower interval overhead than if we did not have them on site," said Jeffrey Paiton, corporate procurement manager at Microsoft.

"What we find is that generally, [outsourcing] costs customers about two-thirds of what they would pay for running their own PC IS services," McKenna said. Hovey disputed this number, saying Kodak has saved one-third of its costs, though it did not say how and didn't detail the effort spent.

Still, even the most optimistic resellers acknowledge that as in enterprise outsourcing, corporations frequently balk at the idea of letting a third party handle items such as training, phone support and PC management. And given the reseller channel's mixed history of providing corporate support, it could take some time to win over corporate accounts.

If at first you don't succeed ...

Resourcing is not the first attempt by the reseller channel to remake itself. Battled for commodity pricing and vendor competition, resellers have long sought to diversify. They first ventured into the services and support arena after the arrival of closed forced down prices, kicking PCs into the commodity market. Those efforts not with added success, depending on the extent to which resellers followed through on support commitments.

The more recent year-old price war has helped make the PC outsourcing route attractive. Resellers today find themselves in the business-thriving position of having both their selling prices and profit margins on houses dropping dramatically and simultaneously.

The reseller mainstays — IBM PC Co., Apple Computer, Inc., and Compaq Computer Corp. — led this trend, cutting prices more than 30% in the last year, while also cutting once-generous dealer margins.

"We can extract that trend with volume, but that's kind of like outsourcing lava," said

Bruce Stuart, president of Chancery Corp., a consultancy in Vancouver, British Columbia. The other way to beat it, he said, is to sell other things to make money, such as services, training and integration, all of which are part of the outsourcing strategy at places such as MicroAge, Compaq and Entex (the latter two divisions of Andersen). But the volume game must be there, period.

Also threatening is the fact that the PC Channelers have aggressively expanded their channels, giving via direct sales, mail-order, catalogs and warehouse clubs while also starting to offer custom configurations that otherwise might be done by resellers.

This in turn is compensated by a series of seemingly endless product shortages. Thus in the last 12 months, a period of double-digit market growth, resellers were short when vendors were unable to supply them.

As a result of these factors, IDC predicts projected 1997 sales through the traditional channel had a drop in overall market share, from 43% this year to 30% in 1997. And outsourcing may not serve some sectors of the channel. — Michael Fitzgerald

Wysiwyg

**What is your
BEST/WORST
job interview
experience?**

**Tale of the ►
Cocky Candidate**

"One candidate was making statements about almost everyone in the industry and how they were doing things wrong. He said that with his help, any company could become the superpower of the industry. He went on to tell how all of his previous employers underappreciated his experience. In this case, I did the same as the rest of the industry — passed on this one!"

▲ Extended Memory

"I met with Judith Hurnitz shortly after I became CEO of Micro Decisionware. I discovered that we were old friends from my days as IBM's vice president of Microdata Systems. The really great news was that I still had credibility with her despite my past efforts to convince her that the IBM 9370 was going to be a real winner in departmental computing. . . ."

▼ Picking up the Pieces

"One interviewee for a product marketing job came into Toronto anxious about relocating and jet-lagged. We had recently won an award and he was asked if the interviewer picked up the award, dropped it and proceeded to turn scarlet from embarrassment. I spent most of the time calming the person down. The interviewer got the job, but we don't discuss awards."

The 5th Wave by Rich Tennant

"It was at this point in time that there appeared to be some sort of mass insanity."

Inside Lines

Now you tell me!

There's a buzz around the Valley that Apple's new CEO, John Sculley, is having second thoughts about his new position. Head of Spectrum Information Technologies, Daniel Chang, used core technologies that allow public companies to transmit data via cellular telephone networks. Spectrum has been involved in several court actions. "Sculley didn't do his homework on this one, and he's going to suffer for that," said one source. Dan Chang, director of marketing at Spectrum, dismissed the rumors as ridiculous. Chang quoted Sculley as saying, "I'm more excited than ever about the opportunity at Spectrum."

Why so shy?

Michael Spindler's reign as Apple's CEO is already marked by secrecy and info-dodging. His keynote at this week's MacWorld conference was suddenly declared off-limits to the press. Spindler has said he won't speak if there are any press people in the room and will stop speaking if any are discovered. During a brief Q&A period after his keynote at last month's Seybold publishing show in San Francisco, he dodged a question about Apple's future directions with a curt "this is not the forum to talk about those matters." Huh? If not in front of thousands of users, then where?

The line forms to the left.

Word circulated last week that the \$60.5 billion Philip Morris conglomerate is considering outsourcing its information utility. According to Merrill Lynch analyst Stephen McNeilan, if the company did a total outsourcing deal, it would be "one of the biggest in history, if not the biggest." General Dynamics Corp.'s \$3 billion deal with Computer Sciences Corp. and McDonnell Douglas' similar-size deal with ISSC are considered the granddaddies of all outsourcing deals. By the way, Philip Morris is currently without an MIS director.

The ox ameth

Unisys Corp., which has cut its staffing to 55,000 after reaching a high of 120,000 in 1996, is planning to ax at least 200 engineering positions at its Great Neck, N.Y., Unisys Government Systems Group (formerly Parsons) facility, according to several employees there who also said they anticipate further cuts down the road.

All on board

Borland plans to announce at Comdex/Fall '98 that Office 2.0 will add support for Borland's Object Exchange Bridge in WordPerfect 6.0, according to sources close to the company. The two firms reportedly plan to license long-term plates for using Borland tools as a common macro language to drive all suite applications.

Does Berlitz do Intel?

Digital plans at Comdex/Fall '98 to demonstrate software for translating Win95/2 applications written for Intel's microprocessors to run on its Alpha AXP architecture under Windows NT. However, Digital has not decided whether the translator should be marketed to software vendors or end users, said Michel Gamberi, its director of Windows NT evangelism. That issue should be resolved within the next couple of quarters, he added. The translator would provide less performance than a native Alpha port, but Digital hopes it will let applications run faster than on Intel's Pentium chip.

Places in the crowd at Digital's annual meeting last week included Jack Smith, former senior vice president, and Doug LeCompte, another vice-president who until recently had been heading the Power PC-critical PowerOpen Association. Smith said he has spent his year off enduro driving, taking flying lessons and starting a home construction business; he's still mulling the idea of "getting back in the swamp" of the computer industry, he added. LeCompte was more about his plane. Phone, fax or CompuServe News Editor Alan Alper with news tips at (800) 248-8474, (508) 875-9831 or 7657-3412, respectively. Or try Computerworld's 24-hour voice-mail tip line at (508) 875-8554.

Given Chipcom's track record, no wonder the others have to sell on price.

OCTOBER 16, 1988

We created the first truly fault-tolerant hub. And we've been building high levels of fault tolerance into all our new hubs, modules and transceivers ever since. Because when you're talking about big mission-critical networking, any downtime is too much downtime.

JANUARY 29, 1990

We were the first to introduce a multi-protocol, multi-network intelligent switching hub. Suddenly, it became possible to run up to 5 Ethernet, 7 Token Rings or 4 FDDI networks, software configurable, in a single hub.

APRIL 29, 1991

We were the first to put Port Switching into an intelligent hub. With it, you can do moves, adds and changes, within or across networks or segments with a couple of clicks of a mouse. Without it, you get to make trips to the wiring closet and move cables. A lot of trips.

MAY 13, 1991

First with network self-healing. With our Network Control System software, our built-in fault tolerance and our Port-Switching technology, your network can not only tell you there's a problem, but is also smart enough to route itself around it automatically. Network service continues without interruption, while you schedule the fix at your convenience.

Chipcom has always seen networking differently than its competitors. Which, given the difference in our backgrounds, isn't surprising.

Instead of building products aimed at departmental LANs, Chipcom has always designed and engineered its products for networks of thousands of nodes. So it's only natural that while others see networking from the bottom up, we view it from

the top down. While they think in terms of an average network life of three years, we see a corporate asset good for ten years or more. Others

regard some downtime as acceptable, we find it unthinkable.

Because we see the network as a whole, we recognize that, while installation price is important, it really represents only 10-20% of overall networking cost. So even though Chipcom's Online System Concentrators cost no more to buy than less functional hubs, we

encourage our customers to ignore outdated formulas like price-per-port, and to think instead about long-term savings, concentrating on the 80-90% represented by network operation and maintenance.

And only the Chipcom architecture offers the combination of engineered-in reliability, the highest degree of fault tolerance, TriChannel™ flexibility, Port Switching and OnDemand™ Network Control System that results in huge savings over the life of your network.

For example, Chipcom's ability to eliminate closet-level moves, adds and

changes alone can save you enough money to repay the entire cost of the network in just three years. Want to make us prove it? Call 1-800-228-9930. Ask for your free copy of "The Real Cost of Networking," the name of a Chipcom VHS tape near you, or to speak to a Chipcom representative.

Or what the heck, ask for all three.

CHIPCOM

Ultimately you are measured by the productivity of your workgroup.

Sharing timely information among coworkers is key to the productivity of your entire workgroup.

That's where Borland's innovative approach to workgroup software comes in. ▲ Thanks to Borland's new Object Exchange technology, products like Quattro® Pro and Paradox® Workgroup Editions have all the workgroup capability you need *built-in*. ■ Unlike other workgroup products, you don't need to change or upgrade your existing network or e-mail software to use it.* You can even share information among applications from anywhere in the world. So whether you have a workgroup of two or two thousand, you can distribute your information wherever you want, while maintaining complete control. It's the painless way to start a workgroup. ● To find out about Borland's Workgroup products and how to buy them easily through our new Advantage program, call Borland today. 1-800-321-3217 ext. 7231.
